1. Product Overview

The NetBorder SS7 to VoIP Gateway is Sangoma's Carrier Class TDM to SIP VoIP Gateway product. For short, it is often referred to as NSG.

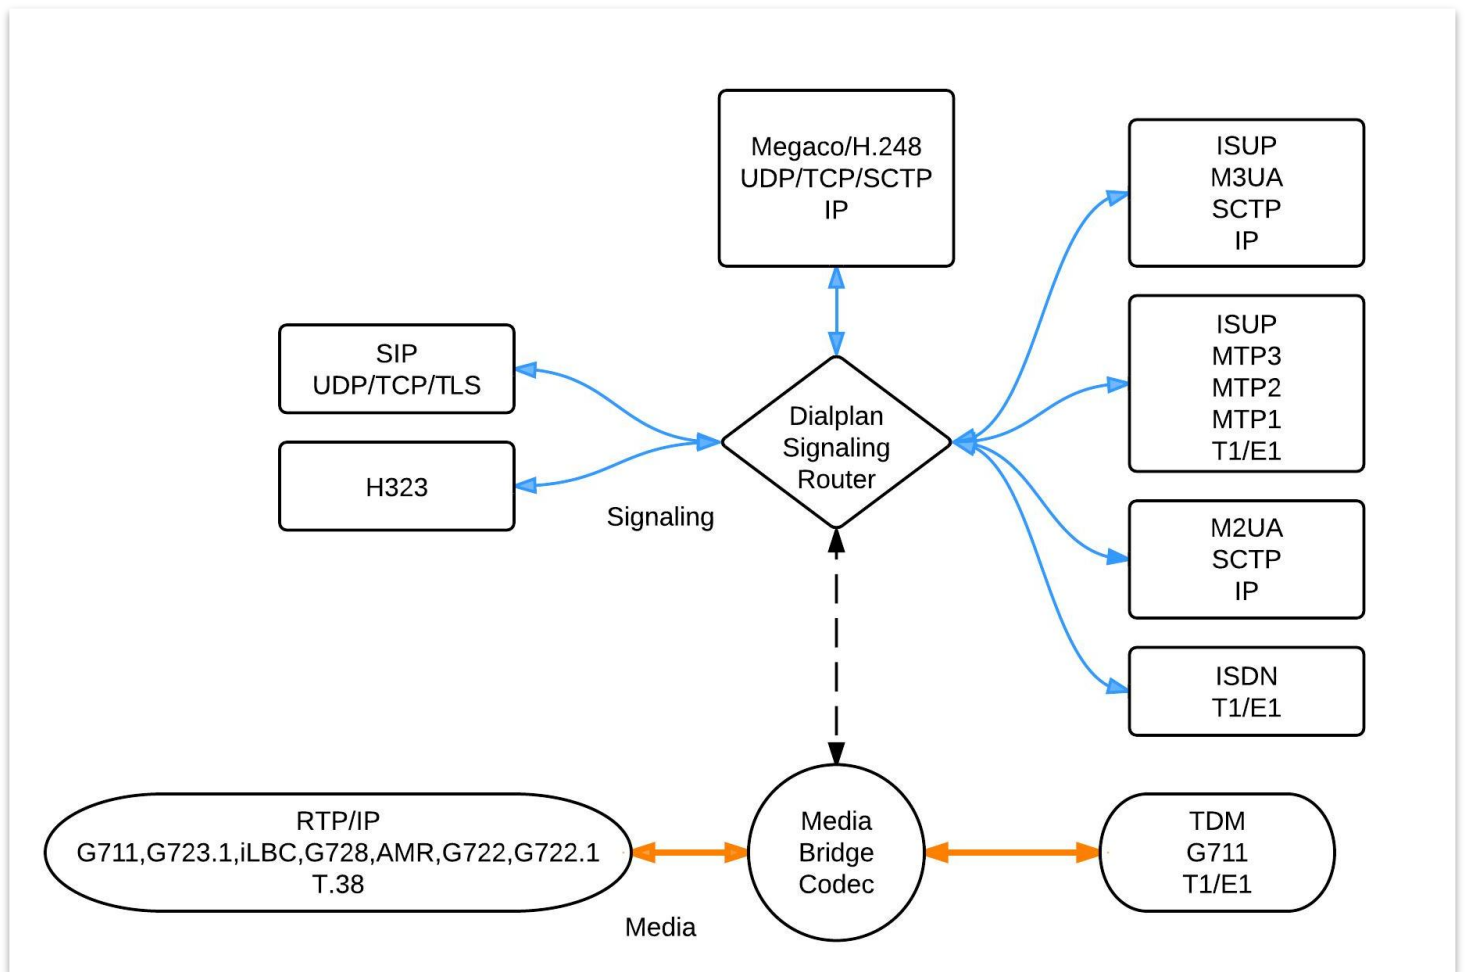

Features / Advantages

- Any to any switching gateway.
 - Ability to run all endpoints/protocols at the same time on single appliance
 - SS7, Sigtran, SIP, H323, Megaco Media Gateway, Signaling Gateway
 - Flexible dial plan to route from any endpoint to any endpoint
- Scalable and very high density
 - Up to 32 E1 per server
 - Can scale up to 288 E1s in relay mode where multiple systems act as one
 - Transcoding available on all channels
- Extensive VoIP Signaling
 - SIP, H323, Megaco/H248
- Full featured SS7/Sigtran Signaling
 - SS7 ISUP Signaling with several national variants
 - ITU, ANSI, Bellcore, France, UK, China, India and Russia
 - Sigtran, M3UA, M2UA
 - Sigtran signaling gateway
- ISDN signaling
 - Q931, QSIG,
- Faxing and Media Support
 - Pass-through
 - T.38
- Wide range of narrowband and wideband codecs supported
For any-to-any codec transcoding
 - G711, G729, AMR
- Robust implementation with distribution

Any to Any Signaling and Media Gateway

- Route any signaling traffic from any signaling endpoint simultaneously.
- Ability to run all protocols together at the same time.
- Route media with transcoding/dtmf/T.38 to/from end media endpoint.

TDM T1/E1 Interfaces

- Minimum 4 T1/E1
- Maximum 32 T1/E1 (960 ports) per appliance
- Transcoding supported on all channels
- Extend capacity over 960 ports via ISUP relay feature and multiple appliances.

Ethernet Network Interfaces

- 2 Gigabit network interfaces

VoIP Protocols

SIP

- SIP V2 / RFC3261 RFC 3261 Session Initiate Protocol
- RFC 2976 SIP INFO Method
- RFC 3398 ISUP-SIP Mapping
- RFC 3515 Refer Method
- RFC 2327 Session Description Protocol
- RFC 3581 An Extension to the Session Initiation Protocol (SIP) for Symmetric Response Routing
- RFC 3892 Referred-By Mechanism
- RFC 3891 "Replaces" Header
- RFC 3551: RTP/AVP
- RFC 3515: REFER
- RFC 2617: HTTP Digest Authentication
- SDP Bypass
- NSG exports all SS7 parameters via SIP custom X headers.

Megaco/H248 & MGCP

- Media Gateway Control Protocol Version 1.0, Internet RFC3435
- PacketCable Network-Based Call Signaling (NCS) Protocol Specification
- PacketCable PSTN Gateway Call Signaling (TGCP) Protocol Specification
- MGCP Basic Packages – RFC 3660
- MGCP Fax Package – draft-andreasen-mgcp-fax-00.txt

H323

Call Handling

- H.225.0 : Call signaling protocols and media stream packetization for packet-based multimedia communication systems
- H.245 : Control protocol for multimedia communication
- H.235, H.450, H.460

DTMF support

- RFC 2833/4733 - "RTP Payload for DTMF Digits, Telephony Tones and Telephony Signals"
- In-band DTMF detection/generation

TDM Protocols

SS7

- ISUP, MTP3, MTP2, MTP1, M3UA, M2UA, Relay
- Variants
 - ITU, ANSI, Bellcore, UK, China, France Spirou, India and Russian
- MTP2
 - ITU 88 & 92, ANSI 88 & 92, Peoples Republic of China
- MTP3
 - ITU 88 & 92 & ETSI, ANSI 88 & 92, 96 & Telcordia (including ANSI MTP3-B), China
- ISUP
 - ITU 88, 92 & 97, 2000, Telcordia 97, ANSI 88, 92, 95 and ETSI v2,v3
 - SPIROU, China, UK, Russia, India

ISDN

- CCITT 88, User & Network Side PRI/BRI
- AT&T 4ESS User Side - PRI, Network Side - PRI
- 5ESS User Side - PRI/BRI, Network Side - PRI/BRI
- DMS-100 User & Network Side - PRI/BRI
- ETSI User & Network Side - PRI/BRI
- Australian Telecom User Side - PRI/BRI and Network Side - PRI
- National ISDN-1 User Side - BRI
- NTT User & Network Side - PRI/BRI
- National ISDN-2 User & Network Side - PRI
- Q.SIG (PRI)
- LAPD & TEI Management

Call Routing

Configurable and extendable XML-based dial plan and routing rules XML Dialplan can be used to create complex routing scenarios between SIP and TDM.

- Call routing based on any call parameter present in a SIP or SS7 IAM message.
- Deep integration with signaling stacks
- Ability to use external applications to build complex routing logic*

Media Processing & Transcoding

Wide range of codecs supported for any to any codec negotiation.

- G.711
- G.723.1
- G.726
- iLBC
- G.729AB
- GSM
- G.722
- AMR
- G.722.1

Echo Cancellation & VQE

Telco grade hardware based echo canceling and Voice processing

- G.168-2002 with 128ms tail
- Noise cancellation
- DTMF Removal
- DTMF Detection
- FAX Detection
- Automatic Gain Control

DTMF Detection and Generation

Sangoma NSG gateway supports multiple DTMF internetworking scenarios.

- RFC2833 Tone Relay
- In-band
- SIP INFO
- Hardware and software DTMF detection and generation

Management and Configuration

Sangoma NSG configuration, operation and troubleshooting is designed to be flexible.

- Web GUI
- Command line interface via ssh and usb to serial
- Call detail records in XML format
- Detailed logs with user configurable file size and auto rotation

Monitoring

- SNMP v1,2,3
- RTCP

Accounting

- Radius

Shipping Options

SKU	DESCRIPTION
SS7-NSG-AP04	Up to 4 E1/T1, ISUP to SIP, codec support, 4 signaling links, up to 12 point codes
SS7-NSG-AP08	Up to 8 E1/T1, ISUP to SIP, codec support, 8 signaling links, up to 12 point codes
SS7-NSG-AP16	Up to 16 E1/T1, ISUP to SIP, codec support, 16 signaling links, up to 12 point codes
SS7-NSG-AP32	Up to 32 E1/T1, ISUP to SIP, codec support, 32 signaling links, up to 12 point codes

Support and Professional Services

Sangoma Engineers are here to support your success. Whether you need technical support and software maintenance, training, consultation and installation services, Sangoma can help you. Please contact your Sales representative for more information.

2. NSG Product Information

NetBorder SS7 to VoIP Gateway Appliance

Fully integrated Industrial grade telco appliance running a customized OS, Netborder SS7 to VoIP application and TDM interfaces configured and installed by Sangoma.

NSG Appliance provides a full-featured, carrier-class VoIP deployment while leveraging the flexibility and cost effectiveness of standard computing platforms.

Hardware Specifications

- Industrial grade telecom appliance
- Size: 1U and 2U - 19" Rackmount
- Min Capacity: 4 T1/E1 (1U)
- Max Capacity: 32 T1/E1 (2U)
- Power: AC, DC, Redundant
- AC Power Supply (Single)
 -
- DC Power Supply (Redundant)
 - The Input Current for -48VDC, is 12.0A (RMS).
 - With Inrush Current of 20.0A MAX.
- Depth: 20"
- Weight: 36lb
- Full Spec on Sangoma Site

NSG Shipping Box Contents

The first three tasks for installing and operating the Netborder SS7 to VOIP Gateway are

- Unpack
- Inspect
- Power up.

Carefully inspect the NSG Appliance for any damage that might have occurred in shipment.

If damage is suspected, file a claim immediately with the carrier, keep the original packaging for damage verification and/or returning the unit, and contact Sangoma Customer Service.

What is included in the box

- Netborder SS7 to VoIP Appliance
 - Appliance can be 1U or 2U depending on model ordered
- Power Cable
 - AC cable in case of AC PSU (black cable)
 - DC cable in case of DC PSU (RED & Black cable)
- Mounting Brackets
- Quickstart user guide

What is not included

- Server Rails
Server Rails are made based on standard. They can be purchased from any third party equipment vendor. For example: General Devices.

Front Panel

Rear Panel 1U

Rear Panel 2U

Rear Panel Description

- Fan
- Internal Power supply
 - Default AC, non-redundant
 - Option: DC or AC Redundant
- Power Button
- Unused Gig Ethernet Port
 - Not used at this time. Should NOT be plugged into the LAN.
- Primary Signaling and Media Gig Ethernet Port
 - This adapter must be plugged into the LAN
 - SIP Signaling and RTP Media will flow through this device.
 - WebUI identifies this device as "eth0"
- Secondary/Monitoring Gig Ethernet Port
 - This adapter is optional
 - It can be used for Monitoring and Statistics
 - WebUI identifies this device as "eth1"
- USB Ports
 - Used to re-flash the appliance
 - Future use: active/standby redundancy*

NSG Appliance Default Configuration

By default the NSG appliance gets shipped with following configuration.

- Static IP 192.168.168.2
- Static IP Port eth0 (Primary SIP Signaling Port)

- WebUI URL http://192.168.168.2:81
- Username root
- Password sangoma

3. First Boot/Initial Setup

- Unpack the NSG shipping box
- Connect the NSG appliance to a power source
- Connect the NSG appliance to LAN
- Connect to NSG appliance via Laptop Browser
- Provision the Appliance
 - Change Password
 - Change Hostname & IP
 - Date Time
 - Self Test
- Initial Provision Done
- Next step is to configure the Gateway.
 - Please refer to usage scenarios in section 5.

Power Connection

Sangoma NSG comes with two types of power supplies

- AC PSU
- DC PSU

AC PSU Connection

- Standard 110V or 220V connection.

DC PSU Connection

Connecting cables to a power supply depends on the remote power source.

<i>Power Source Type</i>	<i>Black Wire</i>	<i>Red Wire</i>
If power source -48V	-48V	0V (Ground)
If power source +48V	0V (Ground)	+48V

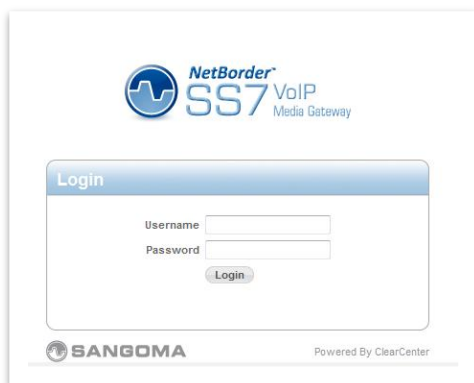

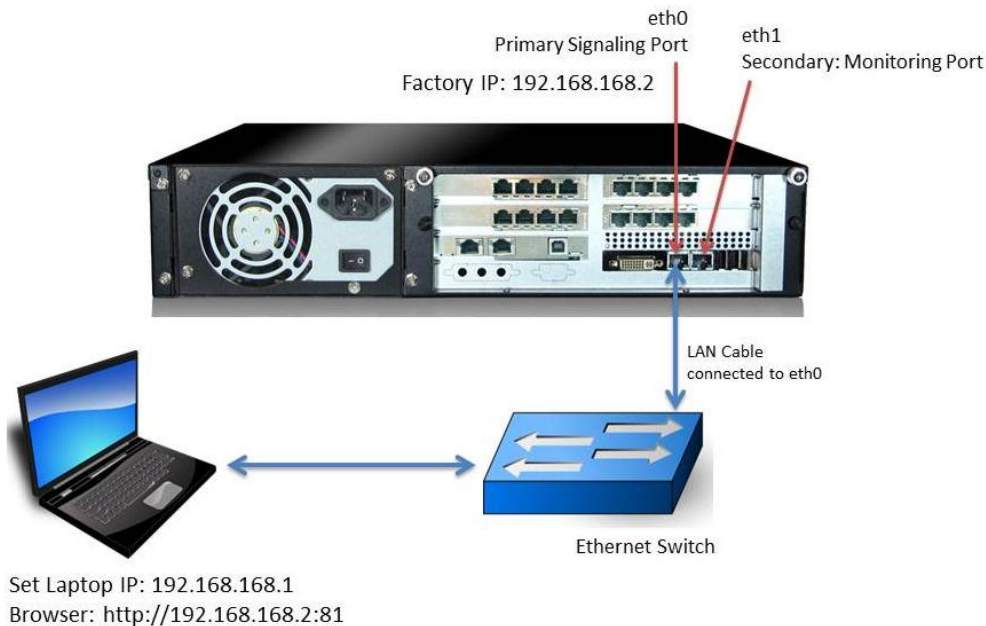

- The PSU **has** voltage reverse protection.
If the red and black wires are connected the wrong way, the system will not power up. But there will be **no** damage to the PSU or the system.

VOLTAGE	DC -36V ~ -72V
INPUT CURRENT:	12.0A (RMS). FOR -48 VDC
INRUSH CURRENT	20A (Max)
DC OUTPUT	400W (Max)

Establishing Initial WebGUI Connection

NSG factory settings are not very useful, as the Primary Ethernet port:eth0 is set to a static IP address. Proceed to connect to the NSG Appliance via Laptop's web browser.

- Connect the Primary Signaling Port:eth0 to a LAN Switch
- Connect Laptop to LAN Switch
- Configure Laptop to IP address: 192.168.168.1/24
- Using Laptop web browser go to URL: <http://192.168.168.2:81>
- Login via
 - Username: **root**, Password: **sangoma**

Relay Mode Check

The very first page after the first successful login will be the Relay Mode Check page.

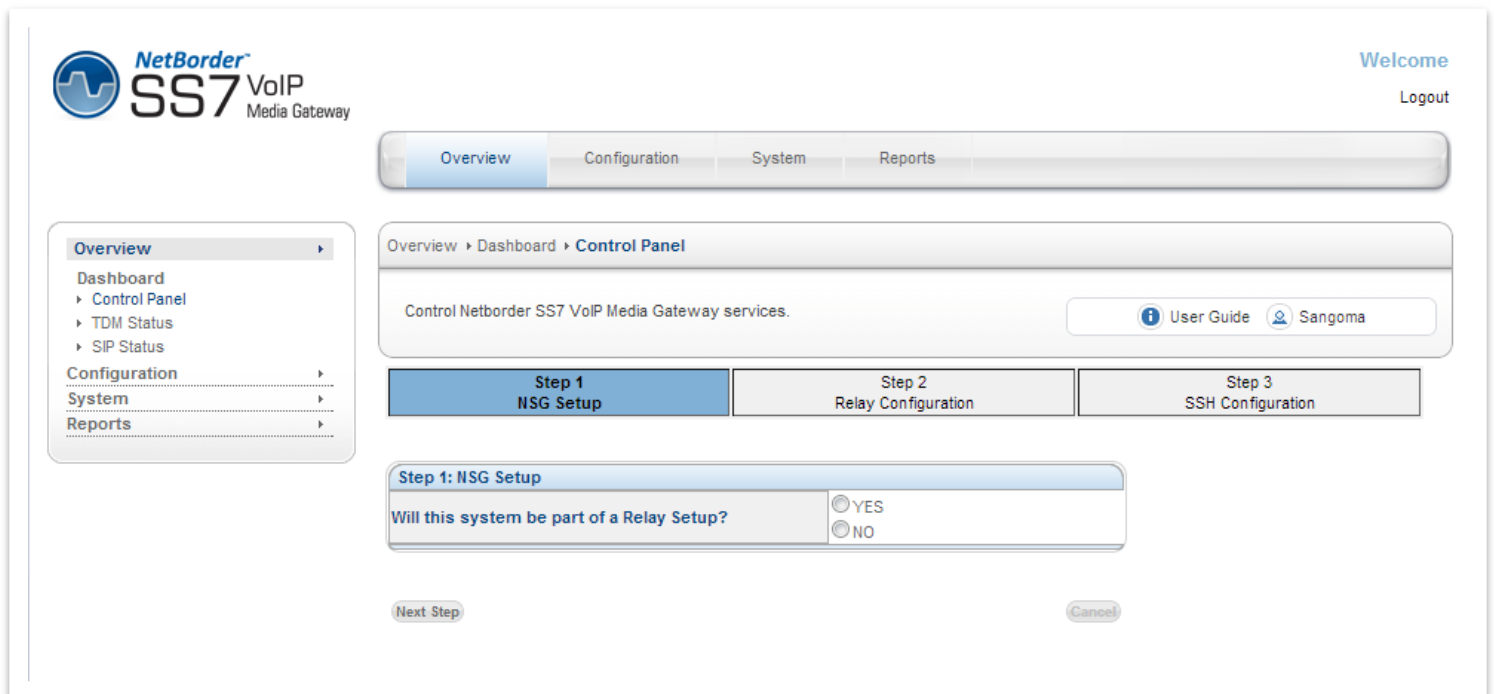

ISUP Relay is a special feature of SS7 protocol that is used in distributed configurations. Distributed setups are based on Master/Slave configurations. Relay feature is fully described in “Relay” section of the document.

If configuring for SS7 ISUP Relay

- Select Yes if this device will act as Master
- Select No for all other configurations. (Default)

Select NO for Relay if

- Planning to run Megaco
- Planning to run ISUP in single server mode
- If not sure, select NO.

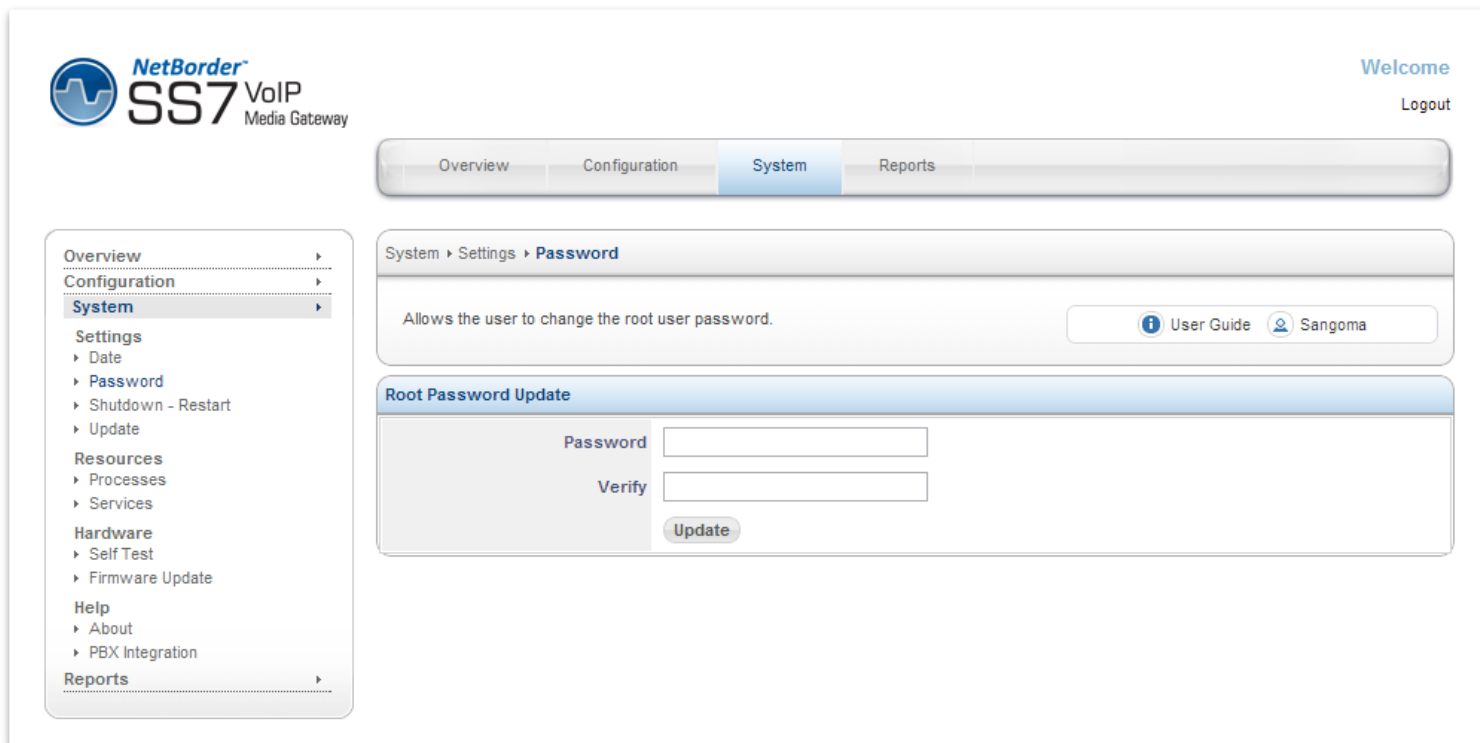

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration', 'System', and 'Reports'. The left sidebar shows a tree view with 'Overview' selected, containing sub-items like 'Dashboard', 'Control Panel', 'TDM Status', and 'SIP Status'. The main content area is titled 'Control Panel' and contains a message: 'Control Netborder SS7 VoIP Media Gateway services.' Below this is a progress bar with three steps: 'Step 1 NSG Setup' (active), 'Step 2 Relay Configuration', and 'Step 3 SSH Configuration'. The 'Step 1: NSG Setup' section contains a form with the question 'Will this system be part of a Relay Setup?' and two radio button options: 'YES' and 'NO'. At the bottom of the form are 'Next Step' and 'Cancel' buttons. The top right corner shows a 'Welcome' message and a 'Logout' link.

Change Password

After successful Login, please proceed to change the default password.

Sangoma NSG appliance comes with default password.
For security reasons please change the password.

- Select **Password** page from side/top **System** menu
- Enter your new password
- Press update to save

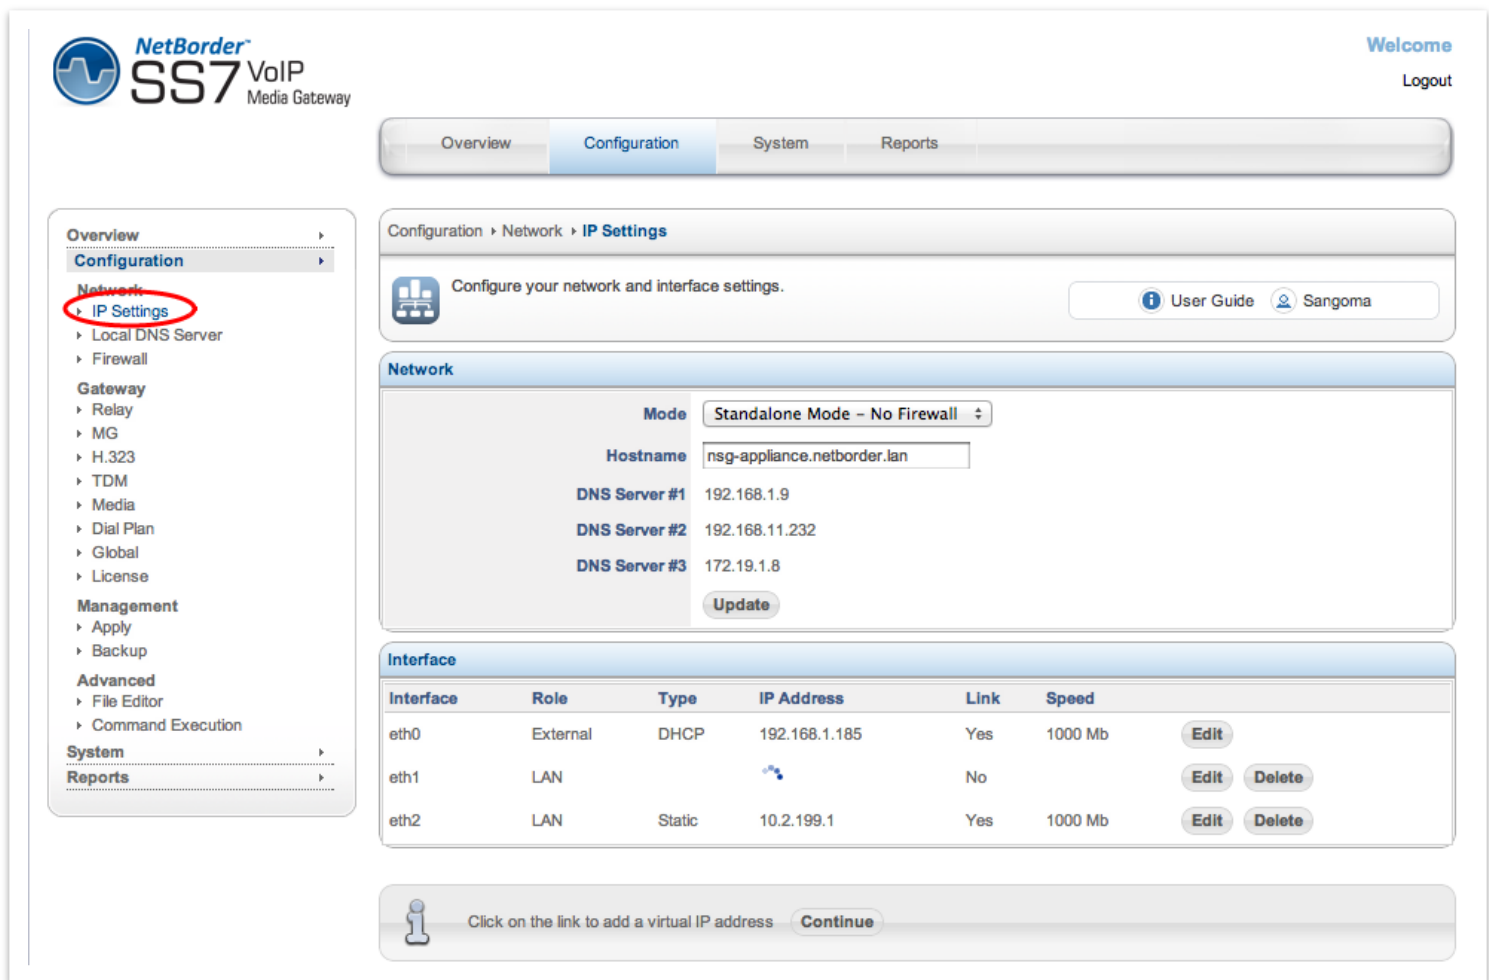

The screenshot displays the web interface of a Sangoma NetBorder SS7 VoIP Media Gateway. The top left features the logo and name. The top right shows a 'Welcome' message and a 'Logout' link. A horizontal navigation bar contains 'Overview', 'Configuration', 'System' (selected), and 'Reports'. A left sidebar lists various system settings and reports, with 'System' expanded to show 'Settings', 'Resources', 'Hardware', 'Help', and 'Reports'. The main content area is titled 'System > Settings > Password' and includes a description: 'Allows the user to change the root user password.' Below this, there is a 'Root Password Update' section with two input fields labeled 'Password' and 'Verify', and an 'Update' button. Links for 'User Guide' and 'Sangoma' are also present.

Hostname & IP Address

By default the NSG appliance pre-configured with 192.168.168.2/24 address on Primary Port (eth0). The IP address can be changed based as follows

- Select **IP Settings** from side/top **Configuration** menu
- Specify Firewall Mode and Hostname
- Select **Edit** under eth0 and eth1 device and configure

NetBorder SS7 VolIP Media Gateway

Network

Mode: Standalone Mode - No Firewall

Hostname: nsg-appliance.netborder.lan

DNS Server #1: 192.168.1.9

DNS Server #2: 192.168.11.232

DNS Server #3: 172.19.1.8

Update

Interface

Interface	Role	Type	IP Address	Link	Speed	
eth0	External	DHCP	192.168.1.185	Yes	1000 Mb	Edit
eth1	LAN	Static	10.2.199.1	No	1000 Mb	Edit Delete
eth2	LAN	Static	10.2.199.1	Yes	1000 Mb	Edit Delete

[Click on the link to add a virtual IP address](#) [Continue](#)

NOTE

eth2 device is a Sangoma Transcoding device and should be modified. Media section of the GUI will configure this device.

Appliance Network Interfaces

- eth0
 - Primary Signaling Port
 - By default provisioned as static 192.168.168.2
 - By default allows access to ssh and management http
- eth1
 - Secondary Signaling or Management Port
 - By default provisioned as static no IP address
 - By default allows access to ssh and management http
- eth2
 - Sangoma transcoding dsp board
 - Provisioned using Media page. Do not modify in this section.

Selecting Default Route

NSG appliance should have a single default route.

The default route is used to access Internet.

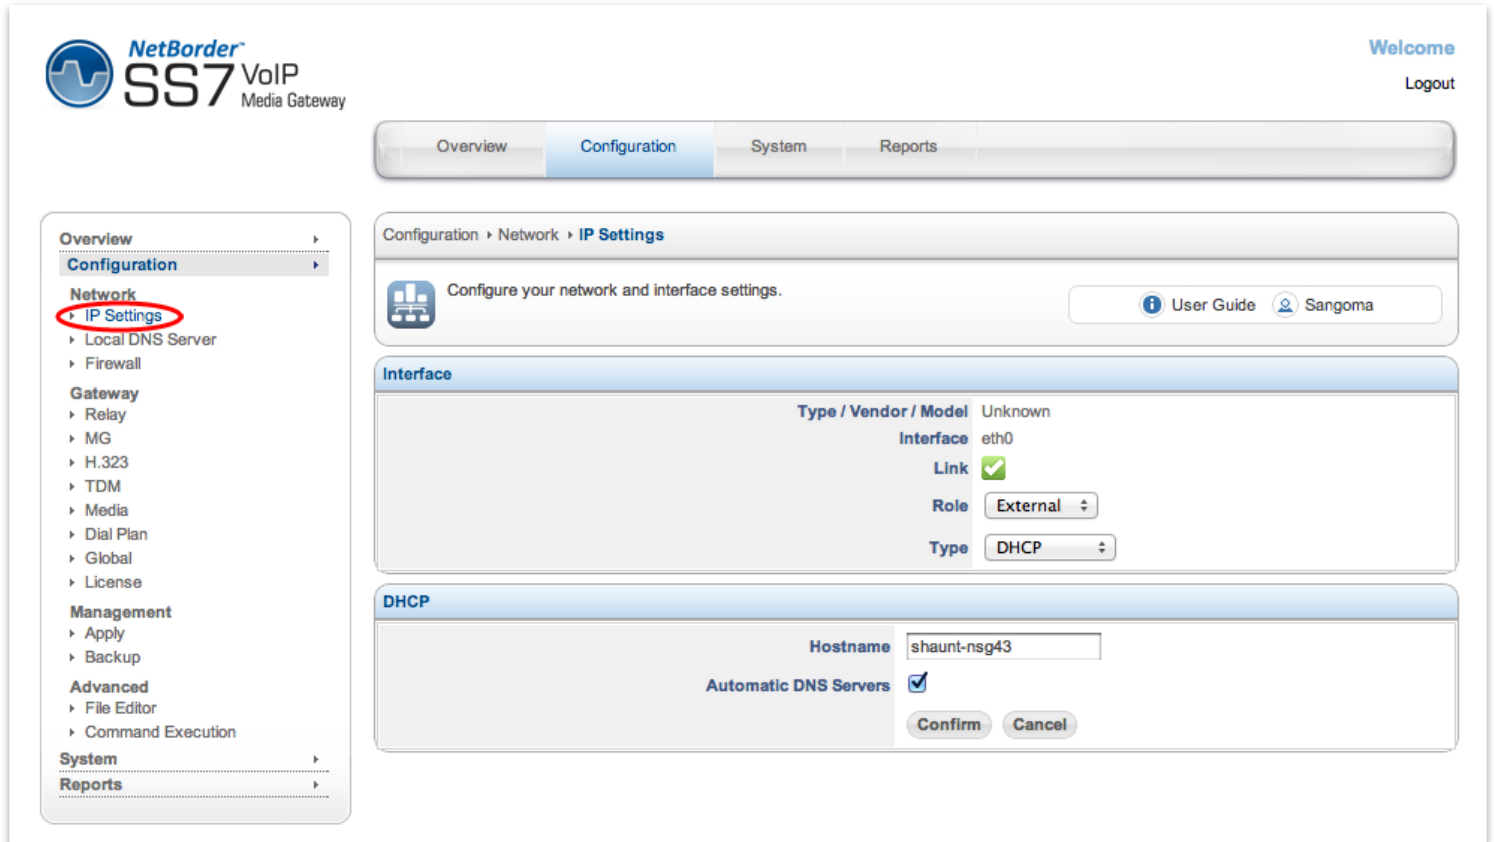

To configure a default route on eth0

- Set the eth0 interface mode to External.
- Refer to section below.

Network Section

Variable Name	Input Options	Description
Mode	Standalone – No Firewall	Firewall Disabled
	Standalone	Firewall Enabled Warning: All active service ports must be explicitly enabled
Hostname	String	A hostname is the full name of your system. If you have your own domain, you can use a hostname like nsg.example.com Alternatively, you can also make one up: gateway.lan, mail.lan. The hostname does require at least one period (.)
Name/DNS Servers	Domain Name or IP address eg. 8.8.8.8	On DHCP and DSL/PPPoE connections, the DNS servers will be configured automatically for your IP Settings. In these two types of connections there is no reason to set your DNS servers. Users with static IP addresses should use the DNS servers provided by your Internet Service Provider (ISP). If you are using Multi-WAN, please review the documentation on the topic of DNS servers.

Interface Section

The screenshot shows the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration' (selected), 'System', and 'Reports'. The left sidebar lists various configuration categories, with 'IP Settings' under the 'Network' section highlighted with a red circle. The main content area is titled 'Configuration > Network > IP Settings' and contains a sub-header 'Interface'. Below this, the 'Interface' section displays fields for 'Type / Vendor / Model' (Unknown), 'Interface' (eth0), 'Link' (checked), 'Role' (External), and 'Type' (DHCP). The 'DHCP' section below it shows 'Hostname' (shaunt-nsg43) and 'Automatic DNS Servers' (checked). 'Confirm' and 'Cancel' buttons are at the bottom right.

Network Role

When configuring a network interface, the first thing you need to consider is the network role in IP Settings. Will this network card be used to connect to the Internet, for a local network, for a network with just server systems? The following network roles in IP Settings are supported in NSG and are described in further detail in the next sections:

- External - network interface with direct or indirect access to the Internet
- LAN - local area network
- Hot LAN - local area network for untrusted systems
- DMZ - de-militarized zone for a public network

Option	Description
External	<p>Network interface with direct or indirect access to the Internet External interface is used as the system default route.</p> <p>WARNING: You should have only ONE external network interface. Usually eth0 is the external interface</p>
LAN	<p>Connection to your local network Usually eth1 is the LAN interface</p>
Hot LAN	<p>Hot LAN (or “Hotspot Mode”) allows you to create a separate LAN network for untrusted systems. Typically, a Hot LAN is used for:</p> <ul style="list-style-type: none"> • Servers open to the Internet (web server, mail server) • Guest networks • Wireless networks <p>A Hot LAN is able to access the Internet, but is not able to access any systems on a LAN. As an example, a Hot LAN can be configured in an office meeting room used by non-employees. Users in the meeting room could access the Internet and each other, but not the LAN used by company employees.</p>
DMZ	<p>In NSG, a DMZ interface is for managing a block of public Internet IP addresses. If you do not have a block of public IP addresses, then use the Hot LAN role of your IP Settings. A typical DMZ setup looks like:</p> <ul style="list-style-type: none"> • WAN: An IP addresses for connecting to the Internet • LAN: A private network on 192.168.x.x • DMZ: A block of Internet IPs (e.g from 216.138.245.17 to 216.138.245.31) <p>NSG GUI has a DMZ firewall configuration page to manage firewall policies on the DMZ network.</p>

Types

Option	Description
DHCP	<p>For most cable and Ethernet networks, DHCP is used to connect to the Internet. In addition, your system will have the DNS servers automatically configured by your ISP when the Automatic DNS Servers checkbox is set.</p>
Static	<p>If you have a static IP, you will need to set the following parameters:</p> <ul style="list-style-type: none"> • IP • Netmask (e.g. 255.255.255.0) • Gateway (typically ends in 1 or 254) • Ethernet Options (able to force 100MB or 1000mb)
PPPoE DSL	<p>For PPPoE DSL connections, you will need the username and password provided by your ISP. In addition, your system will have the DNS servers automatically configured by your ISP when the Automatic DNS Servers checkbox is set.</p>

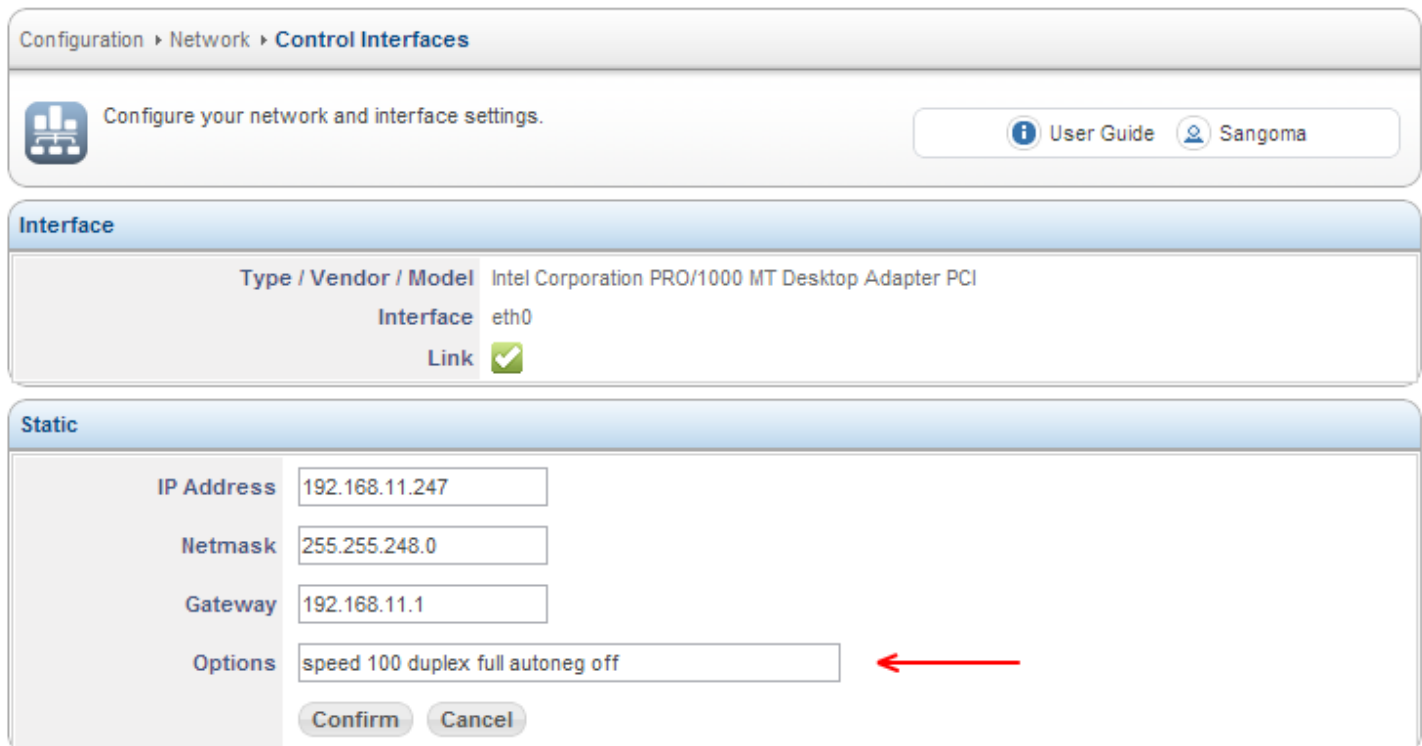

Virtual IP's

NSG supports virtual IPs. To add a virtual IP address, click on the link to configure a virtual IP address and add specify the IP Address and Netmask. You will also need to create advanced firewall rules if the virtual IP is on the Internet.

Ethernet Options

Setting custom Ethernet options such as disabling auto negotiation is done as part of the IP Settings.

- Select **IP Settings** from side/top **Configuration** Menu

The screenshot shows the 'Control Interfaces' configuration page. The breadcrumb trail is 'Configuration > Network > Control Interfaces'. Below the header, there is a description 'Configure your network and interface settings.' and links for 'User Guide' and 'Sangoma'. The main configuration area is divided into two sections: 'Interface' and 'Static'. The 'Interface' section shows the 'Type / Vendor / Model' as 'Intel Corporation PRO/1000 MT Desktop Adapter PCI', the 'Interface' as 'eth0', and the 'Link' status as 'checked'. The 'Static' section contains fields for 'IP Address' (192.168.11.247), 'Netmask' (255.255.248.0), and 'Gateway' (192.168.11.1). The 'Options' field is set to 'speed 100 duplex full autoneg off', with a red arrow pointing to it. At the bottom of the 'Static' section are 'Confirm' and 'Cancel' buttons.

Configuration > Network > Control Interfaces	
Configure your network and interface settings.	
User Guide Sangoma	
Interface	
Type / Vendor / Model	Intel Corporation PRO/1000 MT Desktop Adapter PCI
Interface	eth0
Link	<input checked="" type="checkbox"/>
Static	
IP Address	<input type="text" value="192.168.11.247"/>
Netmask	<input type="text" value="255.255.248.0"/>
Gateway	<input type="text" value="192.168.11.1"/>
Options	<input type="text" value="speed 100 duplex full autoneg off"/>
<input type="button" value="Confirm"/> <input type="button" value="Cancel"/>	

Specify **Options** field in order to add special configuration to this interface.

Options are any device-specific options supported by ethtool.

In above example the Ethernet device is set for 100Mb with negotiation disabled.

Options	[speed 10 100 1000 2500 10000] [duplex half full] [port tp aui bnc mii fibre] [autoneg on off] [advertise %%x] [phyad %%d] [xcvr internal external] [wol p u m b a g s d...] [sopass %%x:%%x:%%x:%%x:%%x:%%x] [msglvl %%d]
----------------	---

IP Troubleshooting

In most installs, the network cards and IP settings will work straight out of the box. However, getting the network up the first time can be an exercise in frustration in some circumstances. Issues include;

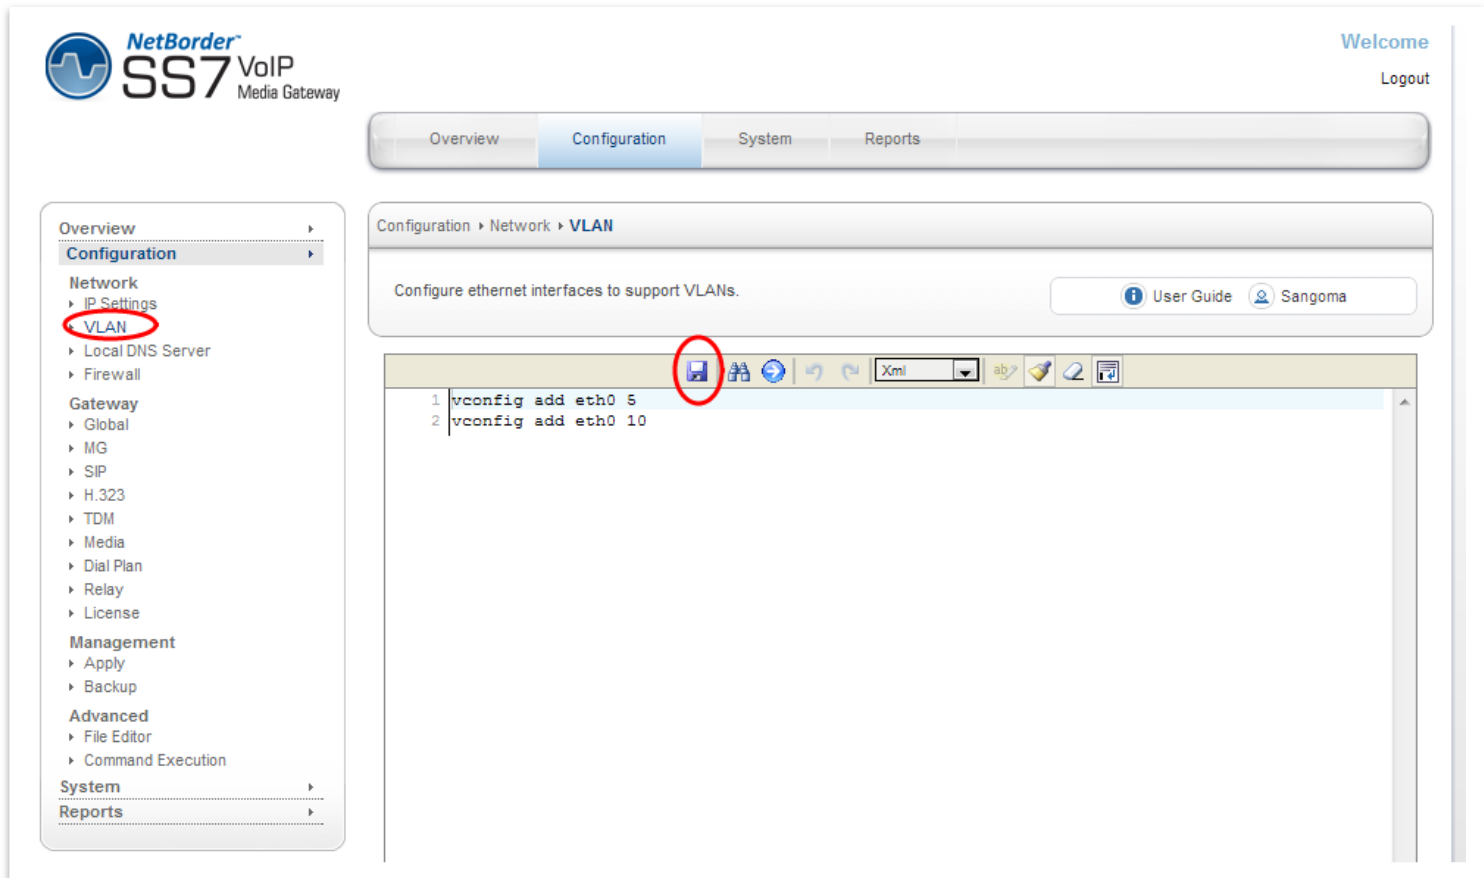

- Network card compatibility
- Invalid networks settings (username, password, default gateway)
- Cable/DSL modems that cache network card hardware information

VLAN

VLAN Configuration

Currently NSG only supports VLAN configuration via CLI/SSH or GUI File Editor

- Select **VLAN** from side/top **Configuration** Menu
- Copy in the VLAN configuration script below into the file editor
- Save
 - On save the VLAN configuration will be applied
 - Proceed to VLAN Status confirm VLAN configuration.

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration' (selected), 'System', and 'Reports'. The left sidebar menu shows 'Configuration' expanded, with 'VLAN' highlighted by a red circle. The main content area is titled 'Configuration > Network > VLAN' and contains the instruction 'Configure ethernet interfaces to support VLANs.' Below this is a text editor with a toolbar (including a save icon circled in red) and a text area containing the following commands:

```
1 vconfig add eth0 5
2 vconfig add eth0 10
```

Additional links for 'User Guide' and 'Sangoma' are visible in the top right of the configuration area.

Sample script that should be copied into the VLAN config startup script:

```
#Create a VLAN device on eth0 interface with VLAN ID of 5
vconfig add eth0 5

#configure VLAN device with IP/Net mask
ifconfig eth0.5 192.168.1.100 netmask 255.255.255.0 broadcast 192.168.1.255 up
```

In the example above, a single VLAN was created on top of the Primary Signaling Ethernet Port:eth0 with VLAN ID=5 and IP =192.168.1.100/24

If more VLAN's are needed, proceed to repeat the above steps for all VLANs.

vconfig help

```
# vconfig
Expecting argc to be 3-5, inclusive. Was: 1

Usage: add      [interface-name] [vlan_id]
      rem      [vlan-name]
      set_flag  [interface-name] [flag-num]    [0 | 1]
      set_egress_map [vlan-name]  [skb_priority] [vlan_qos]
      set_ingress_map [vlan-name]  [skb_priority] [vlan_qos]
      set_name_type [name-type]

* The [interface-name] is the name of the ethernet card that hosts
  the VLAN you are talking about.
* The vlan_id is the identifier (0-4095) of the VLAN you are operating on.
* skb_priority is the priority in the socket buffer (sk_buff).
* vlan_qos is the 3 bit priority in the VLAN header
* name-type: VLAN_PLUS_VID (vlan0005), VLAN_PLUS_VID_NO_PAD (vlan5),
             DEV_PLUS_VID (eth0.0005), DEV_PLUS_VID_NO_PAD (eth0.5)
* bind-type: PER_DEVICE # Allows vlan 5 on eth0 and eth1 to be unique.
             PER_KERNEL # Forces vlan 5 to be unique across all devices.
* FLAGS: 1 REORDER_HDR When this is set, the VLAN device will move the
  ethernet header around to make it look exactly like a real
  ethernet device. This may help programs such as DHCPd which
  read the raw ethernet packet and make assumptions about the
  location of bytes. If you don't need it, don't turn it on, because
  there will be at least a small performance degradation. Default
  is OFF.
```

VLAN Status

- Select **VLAN Status** from side/top **Overview** Menu

Static Routes

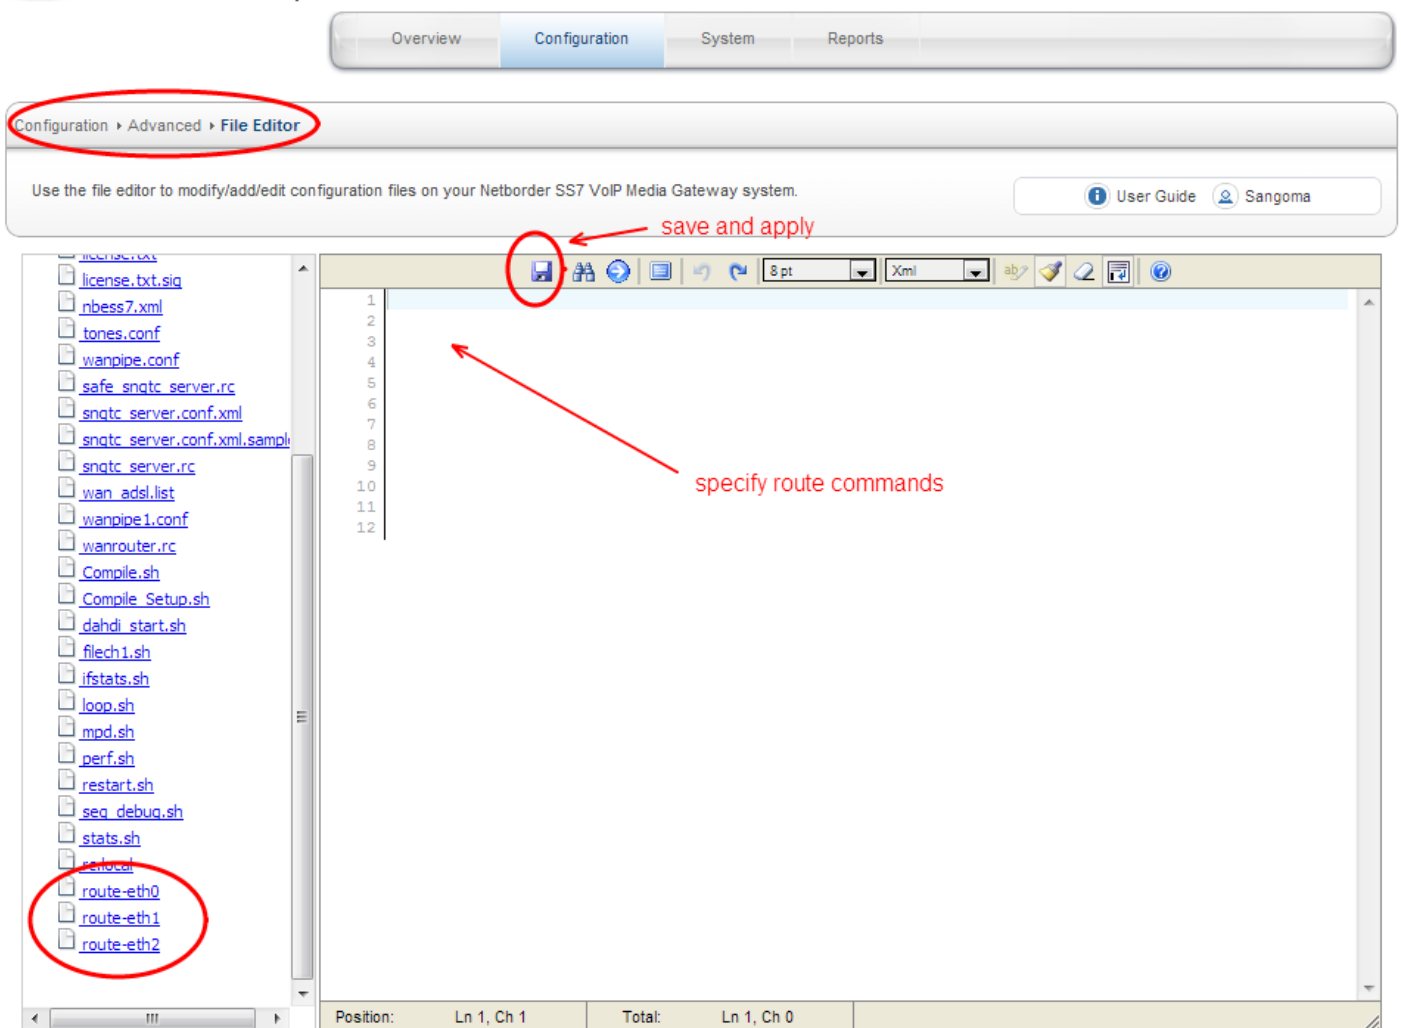

In some cases a static route must be defined for a specific network interface: eth0 or eth1.
The static route support is done via File Editor

- Select **File Editor** from side/top **Configuration** Menu
- Select route-ethX file
- Add a custom route command
- Save and Apply

Welcome

Logout

Configuration > Advanced > **File Editor**

Use the file editor to modify/add/edit configuration files on your Netborder SS7 VoIP Media Gateway system.

[User Guide](#) [Sangoma](#)

save and apply

specify route commands

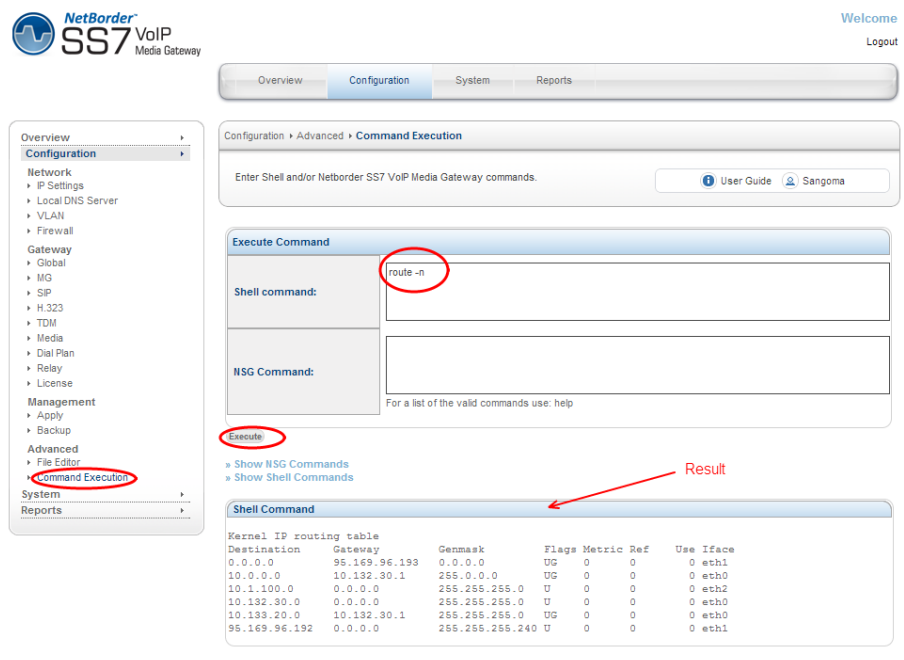

route-eth0
route-eth1
route-eth2

Position: Ln 1, Ch 1 Total: Ln 1, Ch 0

Route File Name	Description
route-eth0	<p>Use to create static routes for Primary Signaling Ethernet Port:eth0</p> <p>Example:</p> <pre>#Route a class C network 10.133.20.0 via gw IP route add -net 10.133.20.0/24 gw 10.132.30.1</pre> <pre>#Route a whole class A range via gw over device eth0 route add -net 10.0.0.0 gw 10.132.30.1 netmask 255.0.0.0 dev eth0</pre>
route-eth1	Use to create static routes for Secondary and Management Port:eth1
route-eth2	<p>Eth2 device is used for media transcoding. So static routes should not be set for this interfaces as they will have no effect.</p> <p>Do Not Use!</p>

Date & Time Service Config

The Date/Time configuration tool allows you to:

- Select your time zone
- Synchronize your clock with network time servers
- Enable/disable a local time server for your network

To configure

- Select **Date** from side/top **System** menu
- Refer below to all available options.

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration', 'System' (selected), and 'Reports'. The left sidebar menu shows 'Overview', 'Configuration', 'System' (selected), 'Settings' (with sub-items: Date, Password, Shutdown - Restart, Update), 'Resources' (with sub-items: Processes, Services), 'Hardware' (with sub-items: Self Test, Firmware Update), 'Help' (with sub-items: About, PBX Integration), and 'Reports'. The main content area is titled 'System > Settings > Date' and contains a calendar icon with the number 23, the text 'Time zone and network time synchronization settings.', and links for 'User Guide' and 'Sangoma'. Below this is a 'Date and Time' section with a table-like structure:

	Date / Time
	Aug 17 2012 00:54:40 EDT
Time Zone	US - Eastern
NTP Time Server	Disabled

At the bottom of the table are two buttons: 'Update' and 'Synchronize Now'.

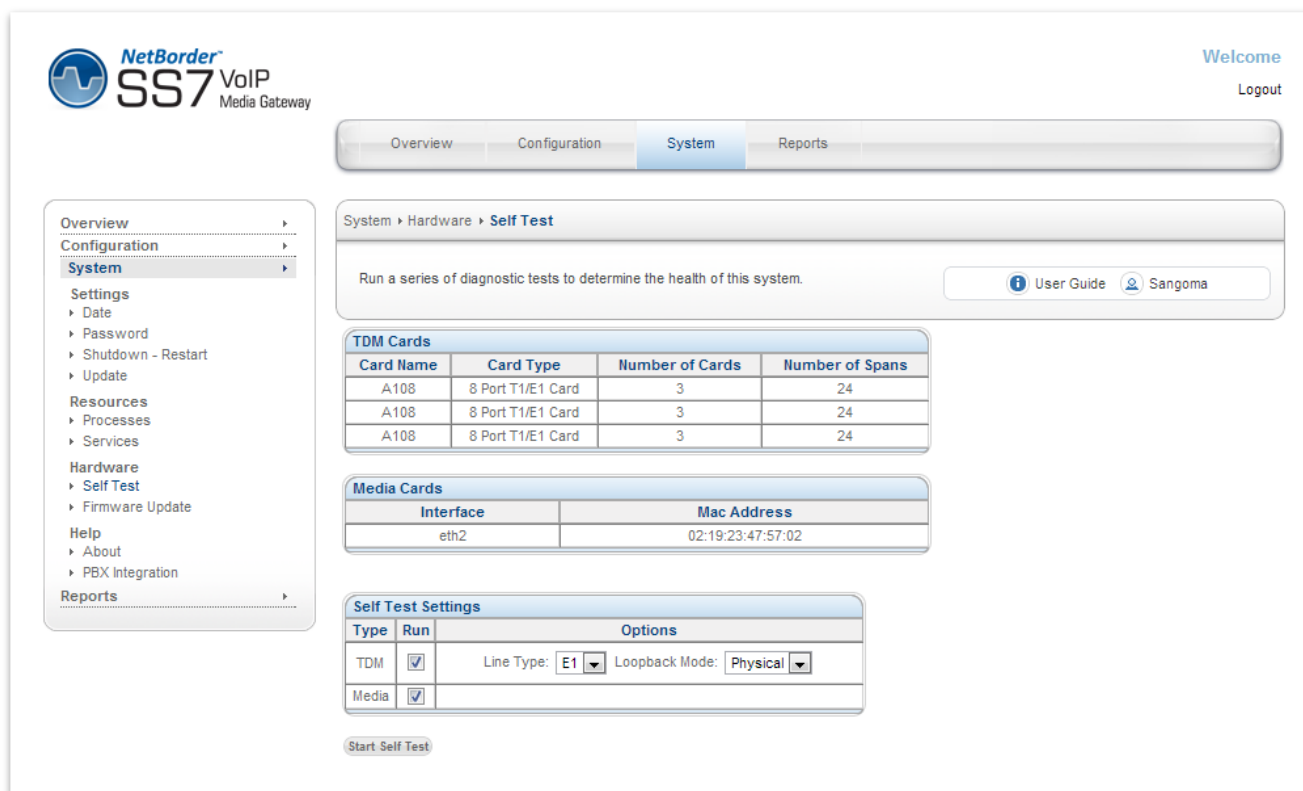

Option	Description
Date/Time	The system date, time and time zone information is displayed for informational purposes. Please make sure it is accurate since it is not unusual to have computer clocks improperly set on a new installation.
Time Zone	It is important to have the correct time zone configured on your system. Some software (notably, mail server software) depends on this information for proper time handling.
NTP Time Server	An NTP Time Server is built into NSG.
Time Synchronization	Hitting the Synchronize Now button will synchronize the system's clock with network time servers.

Self Test

Self-Test page must be run on initial installation or on any hardware upgrade. It will run a battery of tests on Sangoma TDM and Transcoding hardware.

Running Self-Test

- Select Self Test from side/top System Menu
- If in North America select T1
- If not in North America select E1
- Select Media Transcoding Hardware if present.
- Click Start Self-Test
 - Refer to warning section below

The screenshot shows the Sangoma NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration', 'System' (selected), and 'Reports'. The left sidebar menu lists various system settings and hardware options, with 'Self Test' highlighted under the 'Hardware' section. The main content area is titled 'System > Hardware > Self Test' and contains a description: 'Run a series of diagnostic tests to determine the health of this system.' Below this, there are three tables: 'TDM Cards' showing 3 cards with 24 spans each, 'Media Cards' showing the 'eth2' interface with MAC address '02:19:23:47:57:02', and 'Self Test Settings' with checkboxes for 'TDM' and 'Media' (both checked), and dropdowns for 'Line Type' (E1) and 'Loopback Mode' (Physical). A 'Start Self Test' button is located at the bottom of the settings section.

Overview Configuration **System** Reports

System > Hardware > **Self Test**

Run a series of diagnostic tests to determine the health of this system.

[User Guide](#) [Sangoma](#)

TDM Cards

Card Name	Card Type	Number of Cards	Number of Spans
A108	8 Port T1/E1 Card	3	24
A108	8 Port T1/E1 Card	3	24
A108	8 Port T1/E1 Card	3	24

Media Cards

Interface	Mac Address
eth2	02:19:23:47:57:02

Self Test Settings

Type	Run	Options	
TDM	<input checked="" type="checkbox"/>	Line Type: E1	Loopback Mode: Physical
Media	<input checked="" type="checkbox"/>		

Start Self Test

WARNING:

- All services during the Self-Test will be stopped.
- The existing configuration will be restored after Self Test.
- Do not run Self-Test in production!
- Only run Self-Test during on initial setup or during a maintenance window.

The Self-Test can be used to detect:

- Defective TDM hardware
- Defective Media Transcoding hardware
- Miss-configured system device drivers
- PCI Interrupt errors
- Motherboard System issues

NSG License

To update NSG license

- Select **License** from side/top **Configuration** Menu
- Obtain NSG License from Sangoma Support
- Upload the License into the NSG Gateway via the **Upload** Button

The License page offers the detailed license overview.

NOTE

Each NSG appliance comes with pre-installed license. In case of upgrades, of expansions please contact Sangoma Sales.

LICENSE	
SPC	ANY
MAC	00:90:FB:3D:95:9E
CIC	600
HD_SERIAL	20111028465403042123, 20111028465403042110

Available tdm legs

License Information

eth0 MAC Address	00:90:FB:3D:95:9E
eth1 MAC Address	00:90:FB:3D:95:9F
Hard Drive 1 Serial Number	20111028465403042123
Hard Drive 2 Serial Number	20111028465403042110

Update License

Choose File

No file chosen

Upload

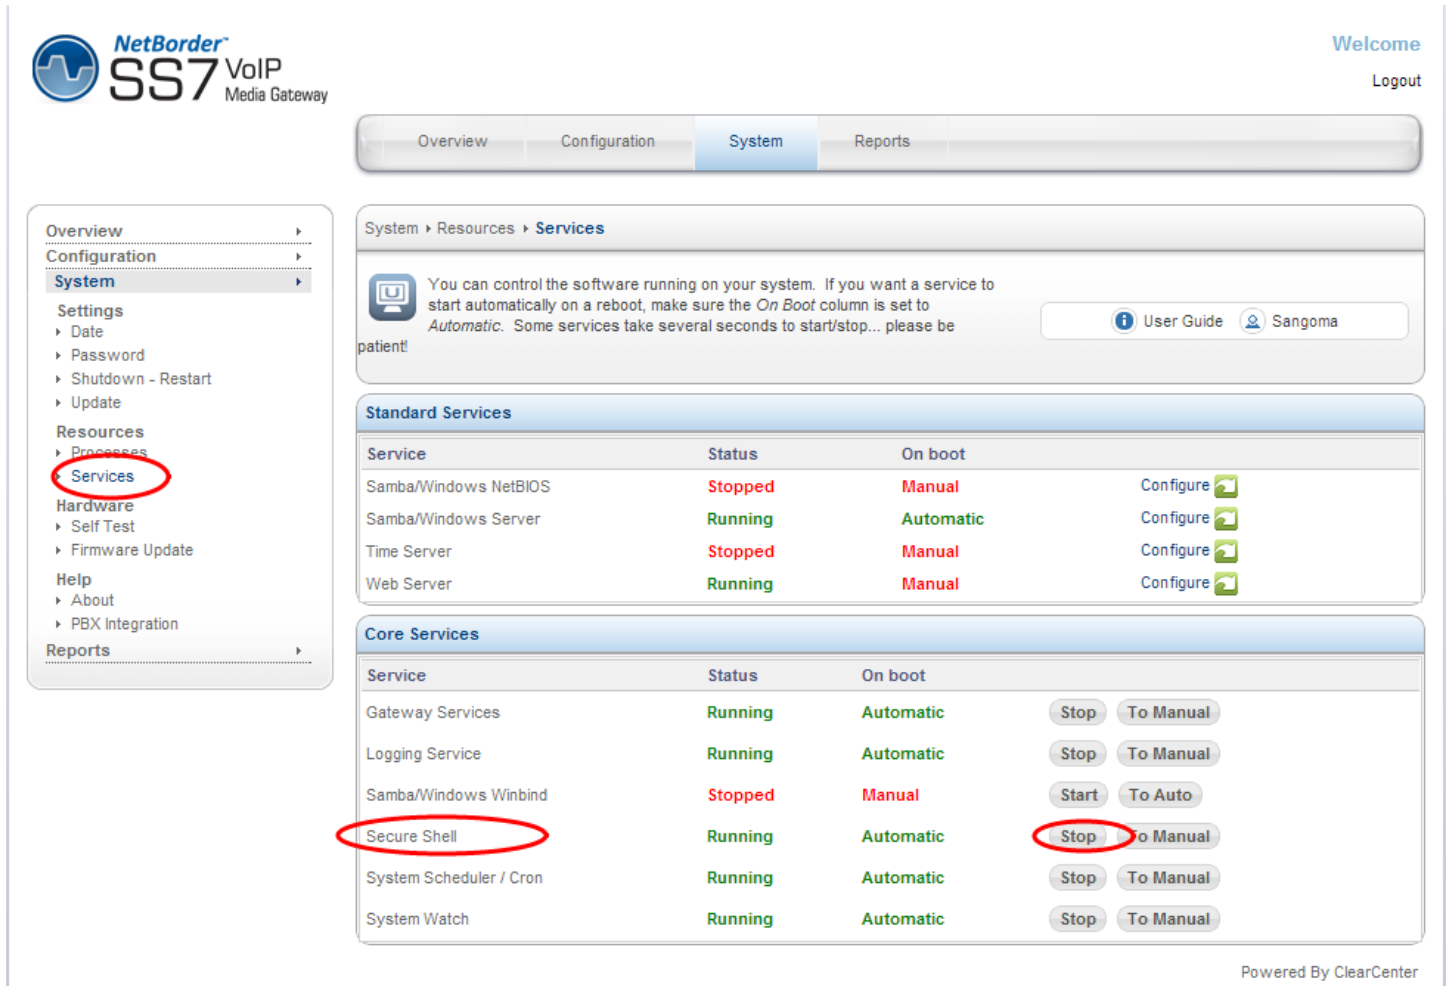

<i>License Variables</i>	<i>Description</i>
Name	Customer Name
Email	Customer Email
Reseller	Reseller Name
License	NA
SPC	SPC stands for: self point code It's used to bind a specific set of point codes to the license. ANY: is a special value which allows use of an SPC value.
MAC	System's MAC address. License code checks the MAC address and confirms if MAC is correct. One can check vs License Information section.
CICS	Number of TDM channels allowed by the license. From example above CICS = 600 For RTP to TDM calls: License allows 600 calls For TDM to TDM calls: License allows 300 calls

Console SSH Configuration

By default NSG systems come with SSH **enabled**.

To configure ssh service

- Select **Services** from side/top System Menu
- Enable or disable **Secure Shell** service

The screenshot shows the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration', 'System' (selected), and 'Reports'. The left sidebar menu has 'Overview', 'Configuration', 'System' (selected), 'Settings', 'Resources', 'Hardware', 'Help', and 'Reports'. Under 'System', the 'Services' option is circled in red. The main content area displays the 'Services' configuration page. It includes a 'Standard Services' table and a 'Core Services' table. In the 'Core Services' table, the 'Secure Shell' service is circled in red, and its 'Stop' button is also circled in red.

Standard Services

Service	Status	On boot	
Samba/Windows NetBIOS	Stopped	Manual	Configure
Samba/Windows Server	Running	Automatic	Configure
Time Server	Stopped	Manual	Configure
Web Server	Running	Manual	Configure

Core Services

Service	Status	On boot	
Gateway Services	Running	Automatic	Stop To Manual
Logging Service	Running	Automatic	Stop To Manual
Samba/Windows Winbind	Stopped	Manual	Start To Auto
Secure Shell	Running	Automatic	Stop To Manual
System Scheduler / Cron	Running	Automatic	Stop To Manual
System Watch	Running	Automatic	Stop To Manual

At this point the Initial Provision is complete.
Proceed to Use Case scenario in order to configure the Gateway.

<i>Service</i>	<i>Description</i>	<i>Status</i>
Samba/Windows NetBIOS	Windows NetBIOS server	Not used / Not required
MySQL	MySQL database	Not used / Not required
Samba/Windows Server	Windows File server	Not used / Not required
Time Server	Network Time Protocol	Should be configured and enabled. Note: There must be internet access to reach the NTP service.
Web Server	web/httpd server	Not used / Not required
Gateway Service	NSG VoIP to SS7 gateway	Do not configure it here Use Control Panel
Logging Services	Syslog, logging service	Should be configured and enabled.
Samba/Windows Winband		Not used/ Not required
Secure Shell	SSH server	Should be configured and enabled.
System Scheduler/Cron	System scheduler	Should be configured and enabled
System Watch	System watch	Should be configured and enabled

User Interface

Netborder SS7 to VoIP media gateway provides the user with two interfaces

- WebGUI
 - Web GUI is preferred for almost all operations
 - Configuration, Operations, Statistics, Reports
- Console via ssh or usb-serial
 - For power users familiar with Linux operating system, ssh or usb-serial console provides advanced and flexible interface for troubleshooting and automation.

WebGUI

- WebGUI resides on the port **81**
- Interface provides two identical menus for easy access to all options
 - Top Horizontal Menu

Welcome
Logout

- Side Vertical Menu

WebGUI Structure

Overview

- Control Panel
 - Used to control the gateway operations: start,stop
- TDM Stats
 - Provides full overview of gateway utilization and states
- SIP Stats
 - Provides full SIP statistics, call count
- VLAN Stats
 - Provides full VLAN statistics, VLAN ID, IP, Netmask for each VLAN.

Configuration

- Network
 - Allows network configuration such as IP, VLAN, DNS and Firewall
- Gateway
 - Core product configuration
 - Provides configuration of all Signaling and Media Protocols
 - SIP, RTP,H323, Media Processing, Megaco(MG), SS7/Sigtran (TDM)
 - Routing Logic / Dialplan
 - XML based dialplan
- Management
 - Apply
 - Write all configurations changed and set in Gateway section.
 - Backup
 - Backup all system configurations into a zip file.
 - Recover a system from a backup file
- Advanced
 - File Editor
 - Allows custom file editing for custom configuration
 - Troubleshooting
 - Command Execution
 - Instead of logging into a shell
 - Execute any system command via the WebGUI.

System

- Settings
 - Date
 - Set date time and sync to time server
 - Password
 - Change password
 - Shutdown
 - Shutdown or reboot a system

- Update
 - Software and patch update system
- Resources
 - Processes
 - List of currently running process
 - Services
 - List of all available services
 - SSH service start/stop
- Hardware
 - Self-Test
 - Allow for system software and hw components test.
 - Firmware Update
 - Allows for firmware updates
 - Sangoma TDM boards
 - Sangoma Media processing boards
- Help
 - About
 - Shows system version and version of all important packages.
 - PBX Integration
 - Help documentation

Reports

- Dashboard
 - Overview
 - Overview of network interfaces
- Network
 - Network Report
 - Long term usage charts for each network device
 - Protocol Capture
 - PCAP packet capture with filter support for any network interface
- System
 - Gateway Logs
 - Specific gateway logs used to quickly trouble shoot gateway issues
 - Allows for log download
 - Advanced Logs
 - Full system wide logs with filters
 - Hardware Report
 - Full hardware overview and description
 - HDD, Memory and system usage
 - Device enumeration
 - Resource Report
 - Long term statistics

Console Structure

- Console access via ssh
- Console access via usb-serial
- Shell Commands via WebUI – Command Execution
- Gateway CLI Commands via WebUI – Command Execution
- Operating system is Linux based. Therefore Linux expertise is mandatory.
- **WARNING**
 - Working in shell is very powerful and flexible, but also dangerous
 - A system can be corrupted, formatted, erased if user makes a mistake.

Connect via SSH

Use default SSH clients on any desktop

- Windows – putty
- Linux – native ssh

On login prompt

- Username: root
- Password: <your custom password>

Connect via USB Serial

- usb to serial cable
 - One must use usb to serial cable + null modem cable
 - If Laptop does not have a serial port then use two usb to serial cables plus null modem cable per diagram below.
- Connect to any usb port on NSG appliance
 - All NSG appliances have usb port on rear panel
 - 2U NSG appliances have usb port in front panel as well.
- Configure Terminal Client on Laptop
 - Windows HyperTerminal
 - Linux – mincomm
- Serial Settings
 - 115200, N, 8, 1 vt100
- Press enter a few times until a login prompt appears.
 - Login via: username: **root** password: **<your personal password>**

Bash Shell

Once successfully logged into the system, either via ssh or usb serial, user will be offered a bash prompt.

- NSG system is based on Linux
- The initial console after login will be a **bash** shell

System Commands

System commands are based on Linux operating systems. Listed here are some most useful debugging commands.

- tcpdump
 - Provides network capture to a pcap file
 - Can be analyzed using wireshark on Desktop or Laptop.
- ethtool
 - Provides detail network interface information, like Ethernet link status.
 - Run: ethtool <enter> for all the options
 - Eg: ethtool eth0 - show Ethernet status
- Ifconfig
 - Network interface statistics tool
 - Shows error counters on Ethernet and TDM interfaces.
 - Notice the error and overrun counters on wanpipe w1g1 interfaces.
- wanpipemon
 - Sangoma TDM troubleshooting tool
 - T1/E1 alarms
 - wanpipemon -i w1g1 -c Ta

Refer to the appendix for all System Commands

Gateway CLI – *nsg_cli*

- First log into the System Console (bash)
- Once on bash prompt run
 - **nsg_cli**

Command	Description
status	Shows NSG Status
show channels	List all active calls
ftdm list	Lists Information on all available spans
ftdm ss7	Displays all SS7 Related Commands
mg	Displays all Megaco Related Commands
log [debug error crit]	Set log level to debug loglevel critical

Gateway CLI

Once in the ssh shell, user can enter the NSG gateway CLI.

NSG Gateway CLI offers advanced gateway statistics and troubleshooting. As well as detail protocol and channel statistics.

- status
 - Call statistics summary of: active calls, calls per sec, total calls
- show channels
 - Detailed list of current active calls
- mg <enter>
 - Megaco statistics
- ftdm ss7 <enter>
 - SS7 statistics
- ftdm list
 - list of all tdm channels

Please refer to the appendix for all Gateway CLI commands.

Shell/CLI from GUI

- Select **Command Execution** from side/top **Configuration** Menu
- Specify a shell or CLI command. Refer to guide below.

4. Usage Scenarios

Signaling Gateway: M2UA

- Pass through signaling from TDM to IP
 - MTP2 -> M2UA
- Pass through signaling from IP to TDM
 - M2UA -> MTP2

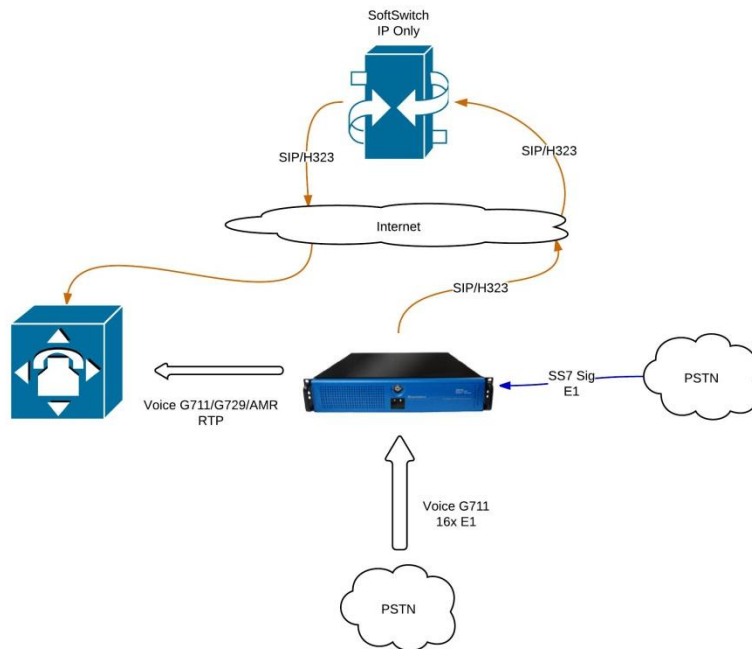

Megaco/H.248 Media Gateway: MG + SG

- Third part Softswitch/MGC controlling Netborder SS7 Media Gateway using Megaco/h.248 protocol.
 - Bridge RTP media to TDM Voice 64kb G711 channels
 - Bridge TDM Voice 64kb G711 channels to RTP media ports
- Media specific functions
 - Transcoding
 - DTMF
 - T38 Faxing

SIP/H323 to SS7 ISUP

- Bridge signaling sessions from H323 to SS7 ISUP
 - Bridge RTP media to TDM Voice 64kb G711 channels
- Bridge signaling session from SS7 ISUP to H323
 - Bridge TDM Voice 64kb G711 channels to RTP media ports
- Media specific functions
 - Transcoding
 - DTMF
 - T38 Faxing

Any to Any Signaling and Media Gateway

- Route any signaling traffic from any signaling endpoint simultaneously.
- Ability to run all protocols together at the same time.
- Route media with transcoding/dtmf/T.38 to/from end media endpoint.

5. Megaco/H.248 Media Gateway Configuration

Create MG Profile

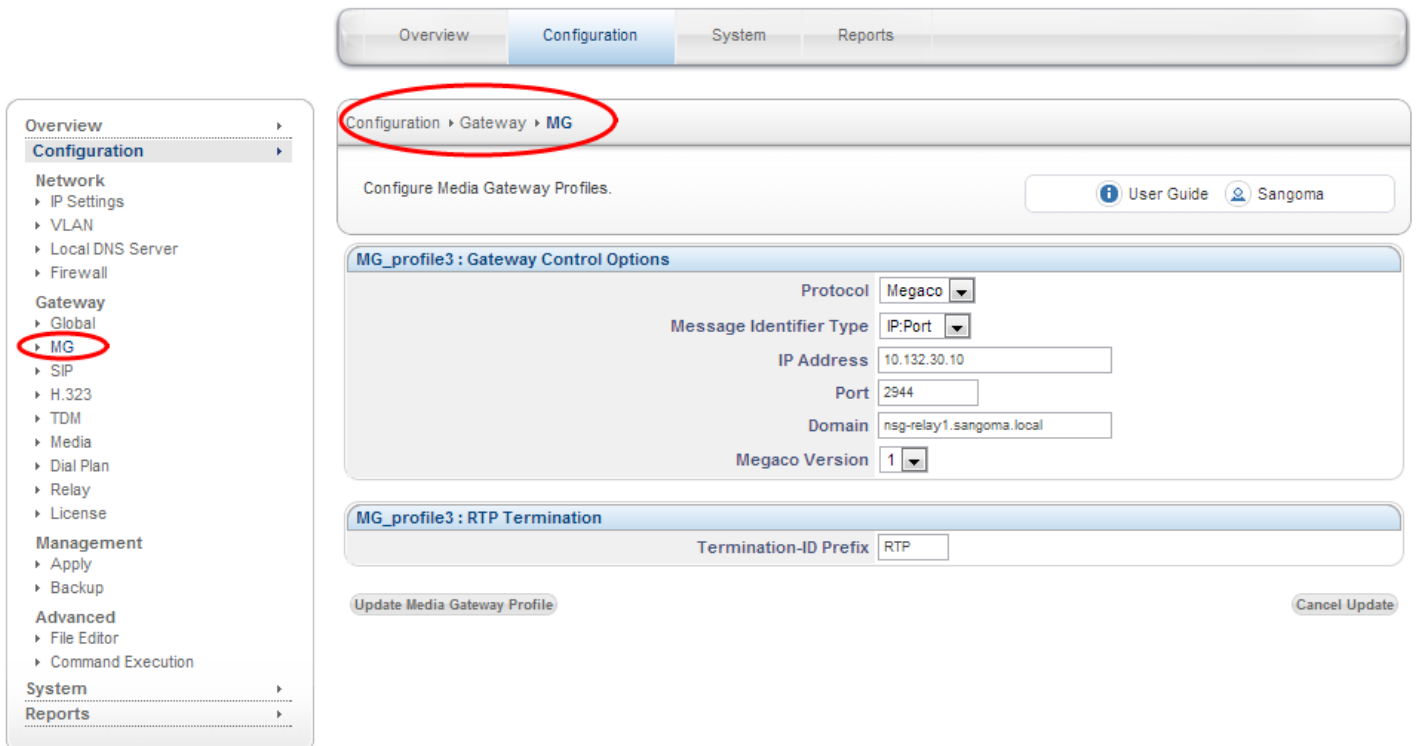

Media gateway profile will contains all the required configuration parameters to bring up the Media gateway stack.

- Select **MG** from the side/top Configuration menu
- Select **Add New Profile**
 - Use default profile name, or specify one
- Select **Create Media Gateway Profile**
- Configure the MG Profile based on information received from our provider.
- Select **Update Media Gateway Profile** to save

Overview Configuration System Reports

Configuration > Gateway > **MG**

Configure Media Gateway Profiles. [User Guide](#) [Sangoma](#)

MG_profile3 : Gateway Control Options

Protocol	Megaco
Message Identifier Type	IP:Port
IP Address	10.132.30.10
Port	2944
Domain	nsg-relay1.sangoma.local
Megaco Version	1

MG_profile3 : RTP Termination

Termination-ID Prefix	RTP
-----------------------	-----

Update Media Gateway Profile Cancel Update

Followings are the fields which need to be configured.

<i>Field Name</i>	<i>Possible values</i>	<i>Default Values</i>	<i>Description</i>
Protocol	MEGACO MGCP	MEGACO	Type of protocol Media Gateway is going to use. NOTE: Currently Media Gateway supports only MEGACO
Message Type Identifier	IP-PORT IP DOMAIN	IP-PORT	Media gateway message identifier (MID) type field will be used to build the message identifier field which Media Gateway will use in all the originating messages. For example: If MID type is IP-PORT then Message identifier format will be "[IP-Address]:Port" If MID type is DOMAIN then message identifier format will be "<Domain>". Refer to Domain section below. If MID type is IP then message identifier format will be "[IP-Address]" Note: IP-Address, Port and Domain values will be as defined above.
IP Address	any ipv4 addr	NA	Media Gateway source IP address.
Port	1 - 65000	NA	Media Gateway source Port.
Domain	(a string value)	NA	Media Gateway domain name. Used as MID Type, when MID Type is set to DOMAIN. Ignored if MID Type is not Domain. Default to system domain name.
Megaco Version	1 2 3	1	Megaco protocol version which Media Gateway will use while communicating with Media Gateway Controller
Termination-ID Prefix	any number starting from 1	NA	RTP termination id prefix which Media Gateway will use while allocating RTP terminations. This variable is used as a name of RTP termination. Eg: RTP/1, RTP/2 ...

Create MG Peer Profile

Each Media gateway profile will associate with one or multiple peers.

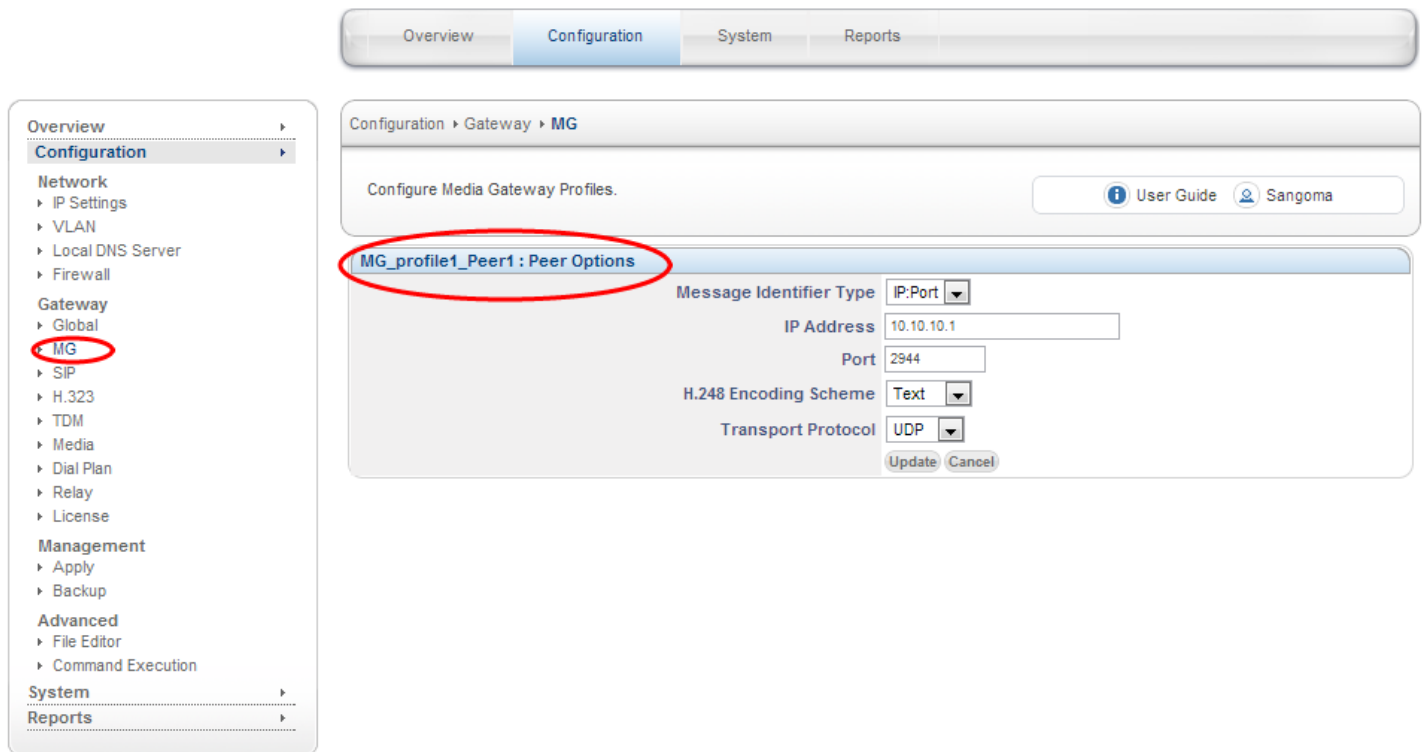

NOTE: As of now NSG supports only “one peer per MG profile”.

- Select **Add Peer** in MG Section
- Fill in the peer information
- Select **Update** to Save

Welcome

Logout

Configuration > Gateway > MG

Configure Media Gateway Profiles.

[User Guide](#) [Sangoma](#)

MG_profile1_Peer1 : Peer Options

Message Identifier Type: IP:Port

IP Address: 10.10.10.1

Port: 2944

H.248 Encoding Scheme: Text

Transport Protocol: UDP

[Update](#) [Cancel](#)

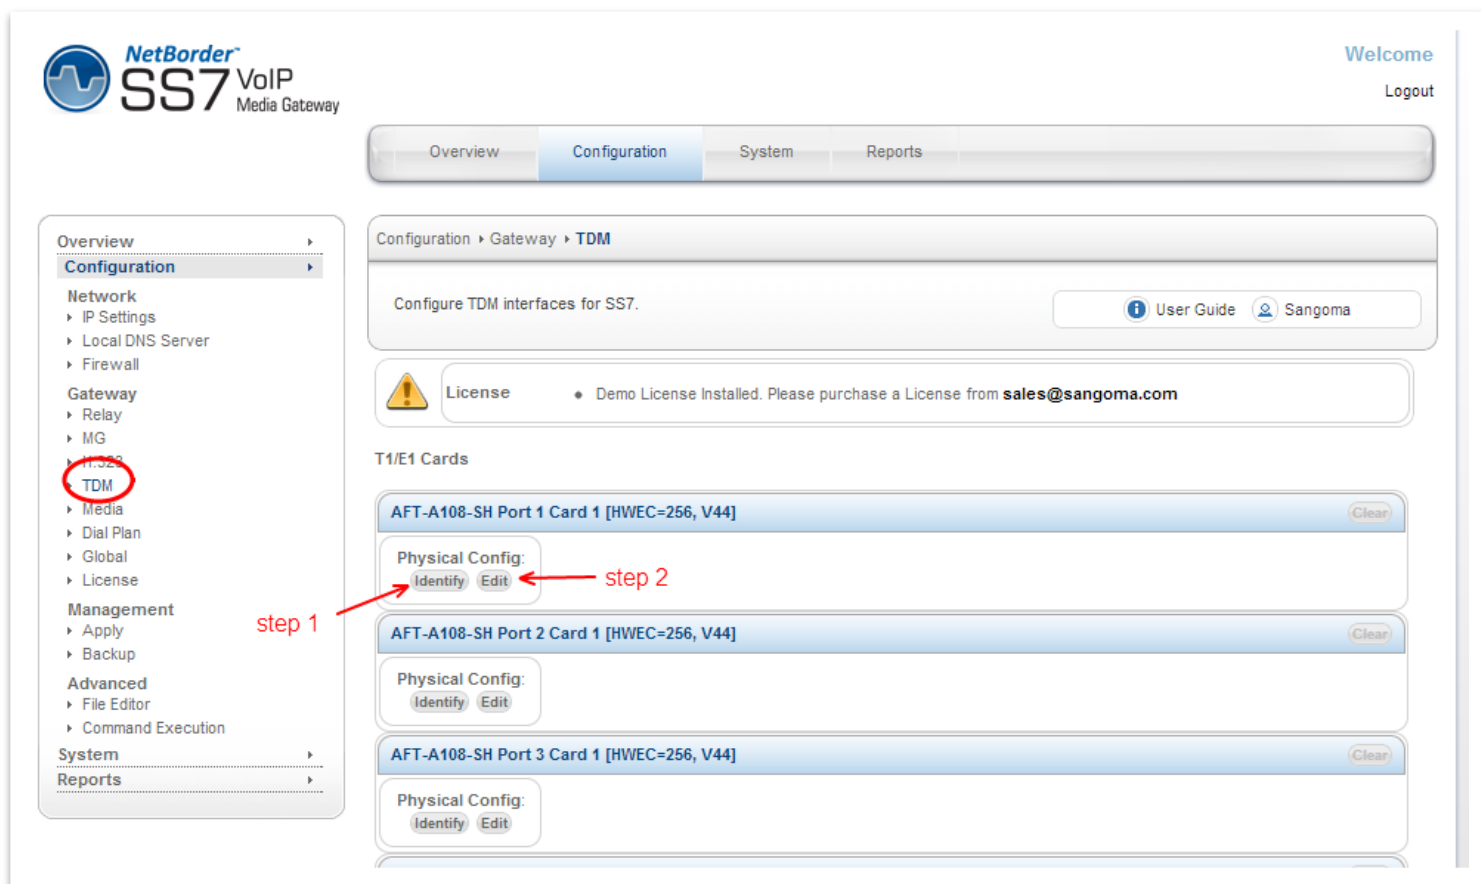

Followings are the fields which need to be configured.

<i>Field Name</i>	<i>Possible values</i>	<i>Default Values</i>	<i>Description</i>
Message Identifier Type	IP-PORT IP	IP-PORT	<p>Media gateway Controller message identifier (MID) type field will be used by Media Gateway to identify the peer.</p> <p>Message identifier value will be built based on MID type field.</p> <p>For example:</p> <p>If MID type is IP-PORT then Message identifier format will be "[IP-Address]:Port"</p> <p>If MID type is IP then message identifier format will "[IP-Address]"</p> <p>Note: IP-Address and Port values will be as defined above.</p>
IP Address	NA	NA	Media Gateway Controller IP address.
Port	NA	NA	Media Gateway Controller Port number
H.248 Encoding Scheme	TEXT BINARY	TEXT	Encoding scheme of MEGACO protocol which will be used by Media Gateway while encoding/decoding the H.248 messages.
Transport Protocol	UDP TCP SCTP	UDP	<p>Media Gateway will use the transport type field to decide which transport to use for transmitting/receiving MEGACO messages.</p> <p>NOTE: currently we are supporting only UDP/TCP.</p>

- Once the **Media Peer** is configured the Megaco configuration section is complete.
- Proceed to **TDM Termination for Media Gateway**

TDM Termination for Media Gateway

- Select **TDM** from side/top **Configuration** menu
- The TDM section will display all installed TDM Spans/Ports.

The screenshot displays the Sangoma NetBorder SS7 VoIP Media Gateway configuration interface. The top navigation bar includes 'Overview', 'Configuration' (selected), 'System', and 'Reports'. The left sidebar menu shows 'Configuration' expanded, with 'TDM' highlighted by a red circle and labeled 'step 1'. The main content area is titled 'Configuration > Gateway > TDM' and contains a warning about a demo license. Below this, the 'T1/E1 Cards' section lists three cards: 'AFT-A108-SH Port 1 Card 1 [HWEC=256, V44]', 'AFT-A108-SH Port 2 Card 1 [HWEC=256, V44]', and 'AFT-A108-SH Port 3 Card 1 [HWEC=256, V44]'. Each card has a 'Physical Config' section with 'Identify' and 'Edit' buttons. A red arrow labeled 'step 2' points to the 'Identify' button of the first card.

Identify

- In order to determine which physical T1/E1 port is: Port 1 Card 1
- Select **Identify** button for Port 1 Card 1
- The LED light will start flashing on a rear RJ45 T1/E1 port: rear panel.
- Look at the rear panel of the appliance and plug in RJ45 cable to the blinking RJ45 T1/E1 port.
- Once the Port 1 Card 1 is identified, the subsequent ports for that board are labeled.
- Or alternatively keep using the Identify feature for each port.

Configure TDM interfaces for SS7.

User Guide Sangoma

Port Identification

You have chosen to identify Port 1 of your 1st A108.
The image below illustrates how your port is identified on the back of your card

To stop the identification process, please click the "Stop Identify" button below

Stop Identify

Each physical RJ45 carries 2 T1/E1 ports on 8 span hardware adapter.

NOTE

Identify picture of the device is always set to A108D – 8 T1/E1 card. The LED will always bling port 1. The image is not meant to reflect the real hardware image, nor real port location.

Edit T1/E1 Config

- Once the port has been identified and plugged into the T1/E1 network.
- Select **Edit** button for Port 1 Card 1 to configure the physical T1/E1 parameters.
- Select the port configuration type: T1 or E1
 - T1: North American Market and Japan
 - E1: Europe and the world
- Fill in Physical Configuration T1 or E1 parameters
 - Fill in the T1/E1 parameters based on the provider provision document.

AFT-A108-SH Port 2 Card 1 [HWEC=256, V44] Clear

- Apply to all Ports
 - Apply to all T1/E1 ports on a board.
 - Bulk config feature
 - (This feature saves time as T1/E1 ports are usually provisioned the same)

Advanced T1/E1 Parameters

The screenshot shows the configuration interface for a NetBorder SS7 VoIP Media Gateway. The left sidebar contains a navigation menu with categories: Overview, Configuration, Network, Gateway, Management, Advanced, System, and Reports. The 'Configuration' category is expanded, and 'TDM' is selected. The main content area is titled 'Configuration > Gateway > TDM' and includes a sub-header 'A108 Port 1 Configuration - E1'. Below this, there are two sections: 'Standard Options' and 'Advanced Options'. The 'Standard Options' section includes settings for Framing (NCRC4), Coding (HDB3), Clock Source (Normal), Reference Clock (No Reference Clock), Hardware Echo Cancellation (Enable), Hardware DTMF (Enable), and Hardware Fax Detection (Disable). The 'Advanced Options' section includes settings for DTMF Removal (Disable), LBO (120 OH), TxTristate (Disable), Signalling Mode (CCS), High Impedance (Disable), RX Level (430 DB), RX Gain (0.0), and TX Gain (0.0). A red arrow points to the 'DTMF Removal' dropdown with the text 'Remove DTMF out of inband media'. At the bottom, there are buttons for 'Apply to Port', 'Apply to all Ports', and 'Cancel Configuration'. A red arrow points to the 'Apply to all Ports' button with the text 'Config usually same for all ports'. A note at the bottom of the interface states: 'NOTE: These options are set to their default parameters and shouldn't be changed unless required.'

Standard Options

Framing	NCRC4
Coding	HDB3
Clock Source	Normal
Reference Clock	No Reference Clock
Hardware Echo Cancellation	Enable
Hardware DTMF	Enable
Hardware Fax Detection	Disable

Advanced Options

DTMF Removal	Disable
LBO	120 OH
TxTristate	Disable
Signalling Mode	CCS
High Impedance	Disable
RX Level	430 DB
RX Gain	0.0
TX Gain	0.0

Apply to Port Apply to all Ports Cancel Configuration

NOTE: These options are set to their default parameters and shouldn't be changed unless required.

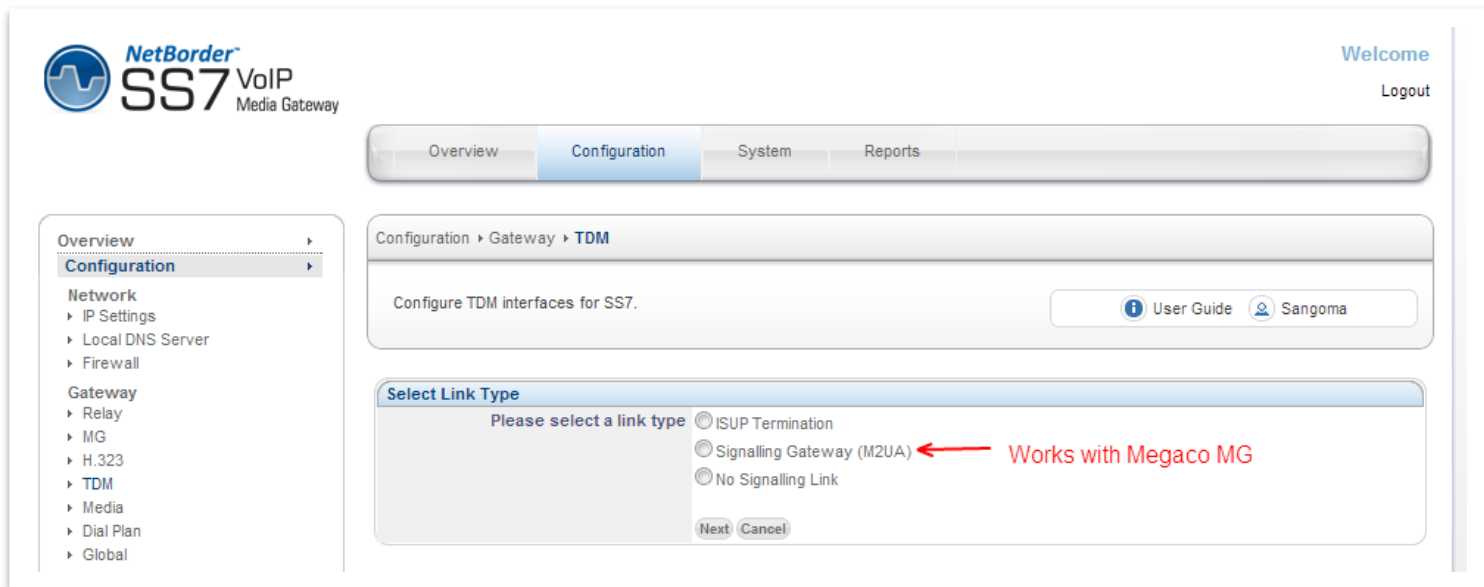

NOTE

After T1/E1 configuration, the NSG wizard will request **Link Type** Configuration.

Span Link Type

When configuring TDM Terminations for Megaco Media Gateway there are two possibilities

- Voice Mode
 - All TDM channels are used for Voice 64kbs G711
 - Example: All channels 1-31 on an E1 line are used for voice
 - Link Type = Voice Only
- Mix Mode
 - Voice 64kbs G711 channels and SS7 signaling channels.
 - Example: Channel 16 is used for SS7 signaling, 1-15,17-31 are used for voice.
 - Link Type = Signaling Gateway (M2UA)
- If configuring for **Voice Mode** select **No Signaling Link**
- If configuring for **Mixed Mode** select **Signaling Gateway (M2UA)**

Select Link Type

Please select a link type

☐ ISUP Termination

☒ Signalling Gateway (M2UA) ← Works with Megaco MG

☐ No Signalling Link

Next Cancel

NOTE

The rest of this section will continue to document the **Signaling Gateway (M2UA)** option.

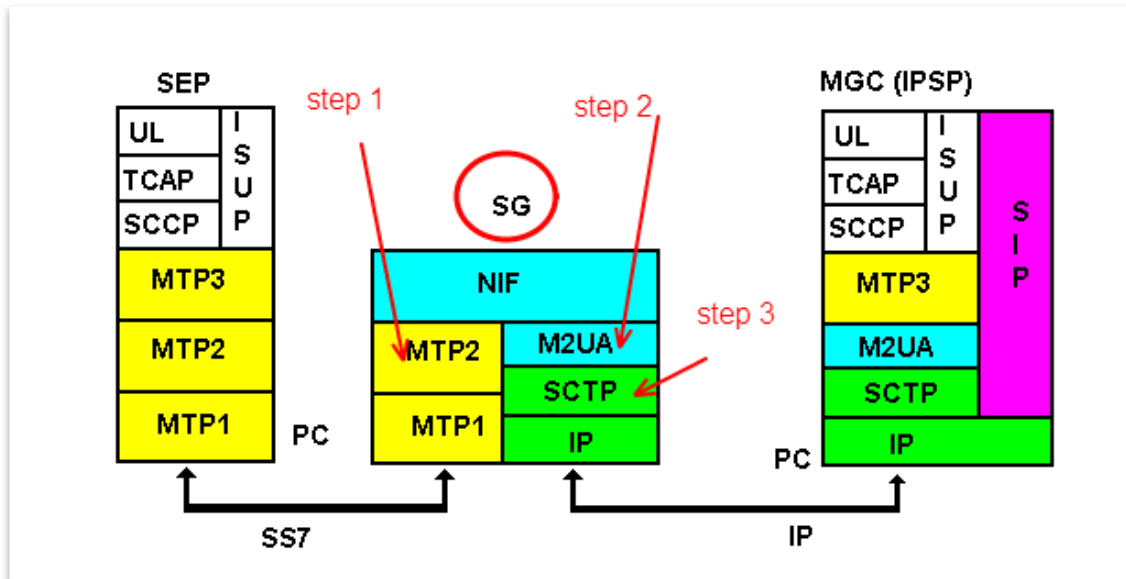

Next page will introduce the Signaling Gateway Overview, followed by the next config section in the WebGUI.

Signaling Gateway Overview

NSG supports Signaling Gateway operation mode.

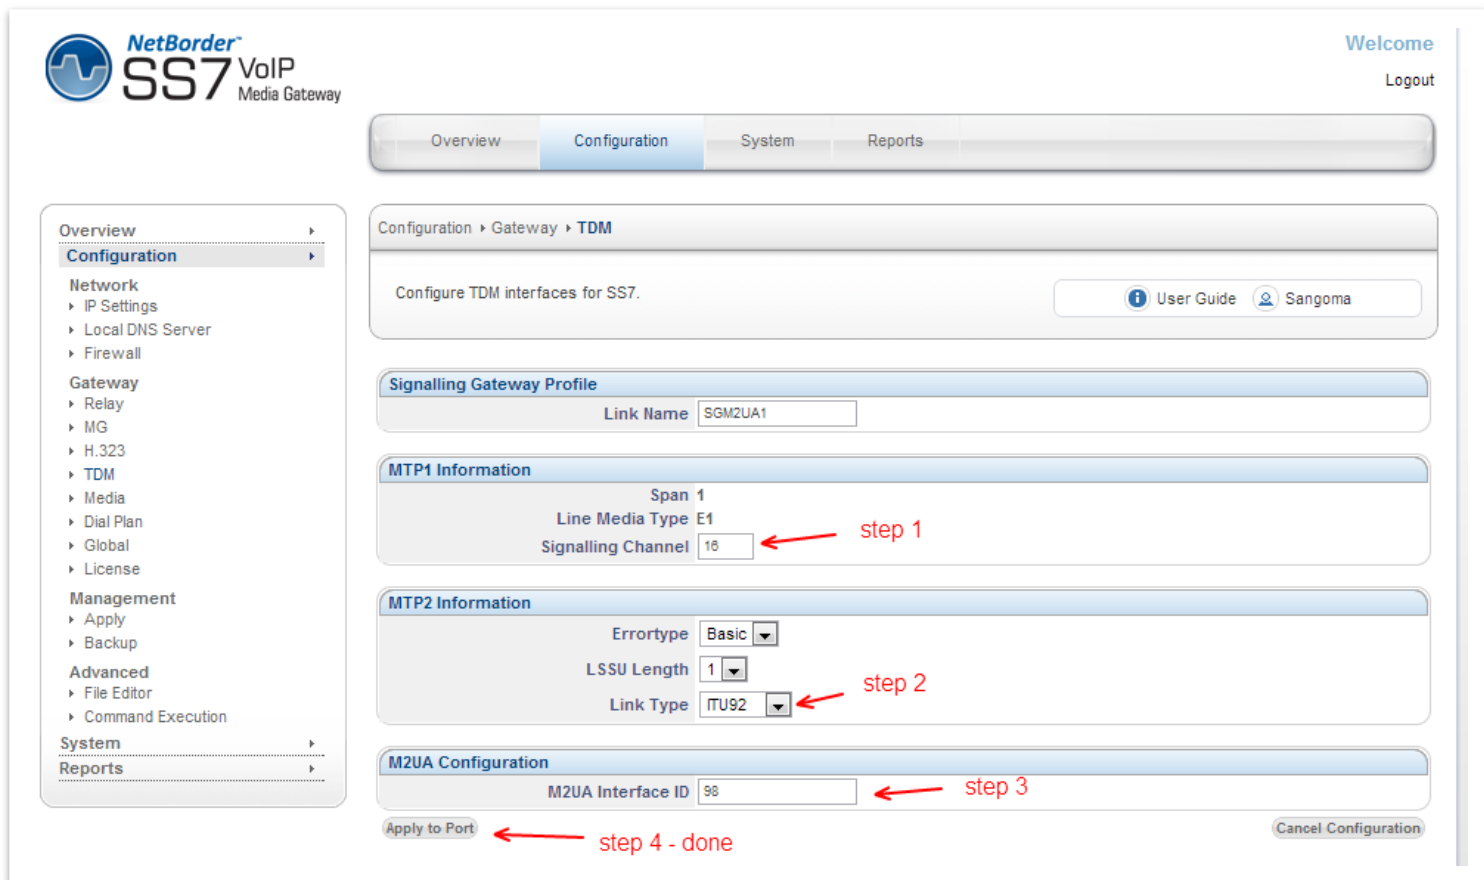

In Signaling gateway mode, NSG will bridge T1/E1 SS7 signaling link to IP and pass it transparently to the MGC/Softswitch, via M2UA protocol. Looking at the diagram below, NSG Signaling Gateway will configure:

- MTP1 & MTP2 protocols over the TDM port
- M2UA/SCTP protocol over IP network
- NIF (Network interworking function) to bridge the two

MTP1/2 Link Configuration

- Specify MTP1/2 information based on provider provision document
- Step1: Identify which channel on T1/E1 line will carry signaling
- Step2: Specify MTP2 signaling information based on provision document
- Step3: Specify M2UA Interface ID based on provision document
- **Apply to Port** to save configuration

The screenshot shows the NetBorder SS7 VoIP Media Gateway configuration interface. The left sidebar contains a navigation menu with sections: Overview, Configuration (selected), Network, Gateway, Media, Management, Advanced, System, and Reports. The main content area is titled 'Configuration > Gateway > TDM' and contains the following sections:

- Signalling Gateway Profile:** Link Name: SGM2UA1
- MTP1 Information:** Span: 1, Line Media Type: E1, Signalling Channel: 16 (indicated by a red arrow and 'step 1')
- MTP2 Information:** Errortype: Basic, LSSU Length: 1, Link Type: ITU92 (indicated by a red arrow and 'step 2')
- M2UA Configuration:** M2UA Interface ID: 98 (indicated by a red arrow and 'step 3')

At the bottom, there are two buttons: 'Apply to Port' (indicated by a red arrow and 'step 4 - done') and 'Cancel Configuration'.

<i>Field Name</i>	<i>Possible Values</i>	<i>Default Value</i>	<i>Description</i>
Link Name	NA	NA	M2UA Profile name
Span	NA	NA	Span number which is going to associated with this M2UA profile.
Line Media Type	E1/T1	E1	Media type
Signaling channel	NA	NA	Signaling channel of the span which will carry the M2UA signaling messages.
ErrorType	Basic/PCR	Basic	MTP2 error type.
LSSU length	1/2	1	LSSU length
Link Type	ITU92 ITU88 ANSI96 ANSI92 ANSI88 ETSI	ITU92	SS7 link variant.
M2UA Interface ID	NA	NA	M2UA Interface identifier which will map to this particular signaling span/channel and uniquely identify the link between M2UA SG and MGC.

NOTE

Next section in WebUI will relate to M2UA configuration. Before we proceed however, the M2UA interface architecture will be introduced in order to provide a big picture to the user.

M2UA Interface

This section provides in-depth overview on how the M2UA interface is constructed. It should help the user better understand the WebUI configuration objects for M2UA protocol.

WebUI for M2UA contains 3 sections: Cluster, Peer and SCTP

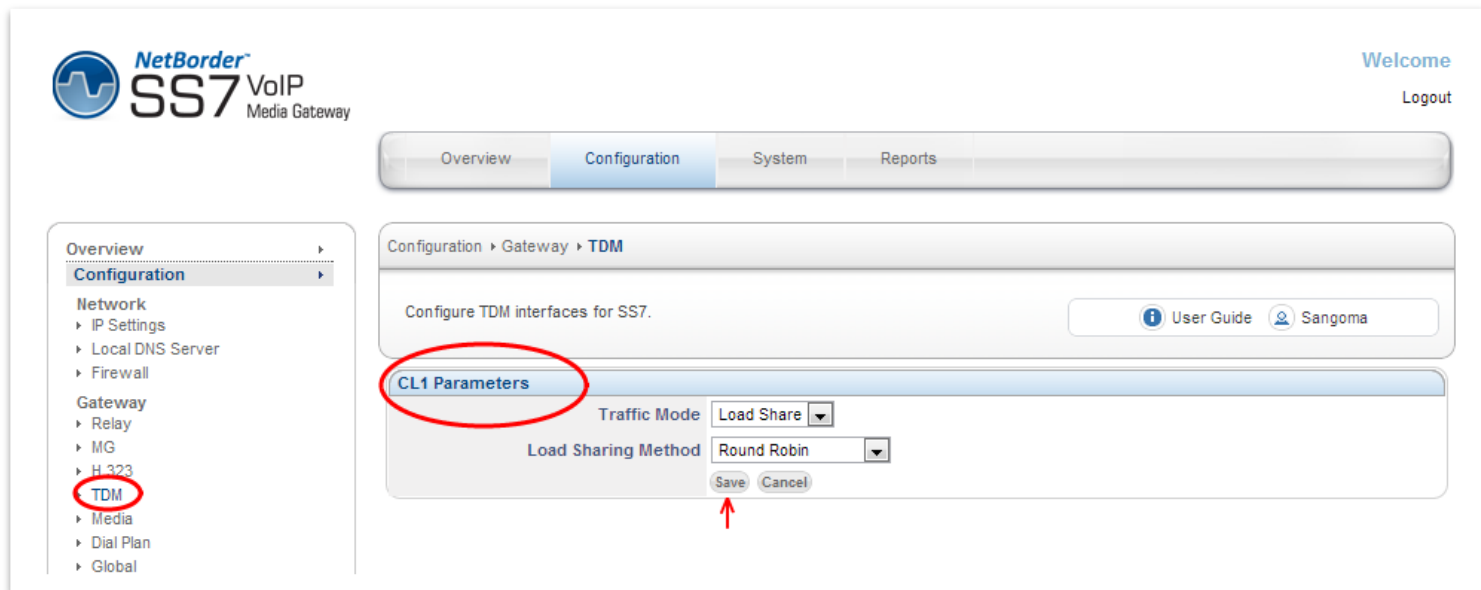

- SCTP interfaces are standalone objects on which a peer bind to (regardless of its cluster).
 - 1 SCTP binds to 1 or more peers
 - 1 peer binds to 1 SCTP
 - Thus SCTP are shared across all peers
 - SCTP cannot be deleted if used by any peer (even from another cluster).
 - Deleting a peer or a cluster does not delete SCTP.
- Peers are bound to cluster.
 - 1 peer binds to 1 cluster
 - 1 cluster binds to 1 or more peer
 - Deleting a cluster will delete peers.
- Cluster are bound to mtp2 through m2ua binding and nif interface
 - 1 cluster binds to 1 or many mtp2 (through m2ua->nif relationship)
 - 1 mtp2 binds to 1 cluster through nif interface binding

M2UA Cluster Creation

M2UA Cluster is a group of peers to which M2UA SG will communicate

- Select Create Cluster
- Leave the Cluster values default unless the provider specifies otherwise.
- Select **Save** to Continue

NetBorder[®] SS7 VoIP Media Gateway

Overview Configuration System Reports

Configuration > Gateway > TDM

Configure TDM interfaces for SS7. [User Guide](#) [Sangoma](#)

CL1 Parameters

Traffic Mode: Load Share

Load Sharing Method: Round Robin

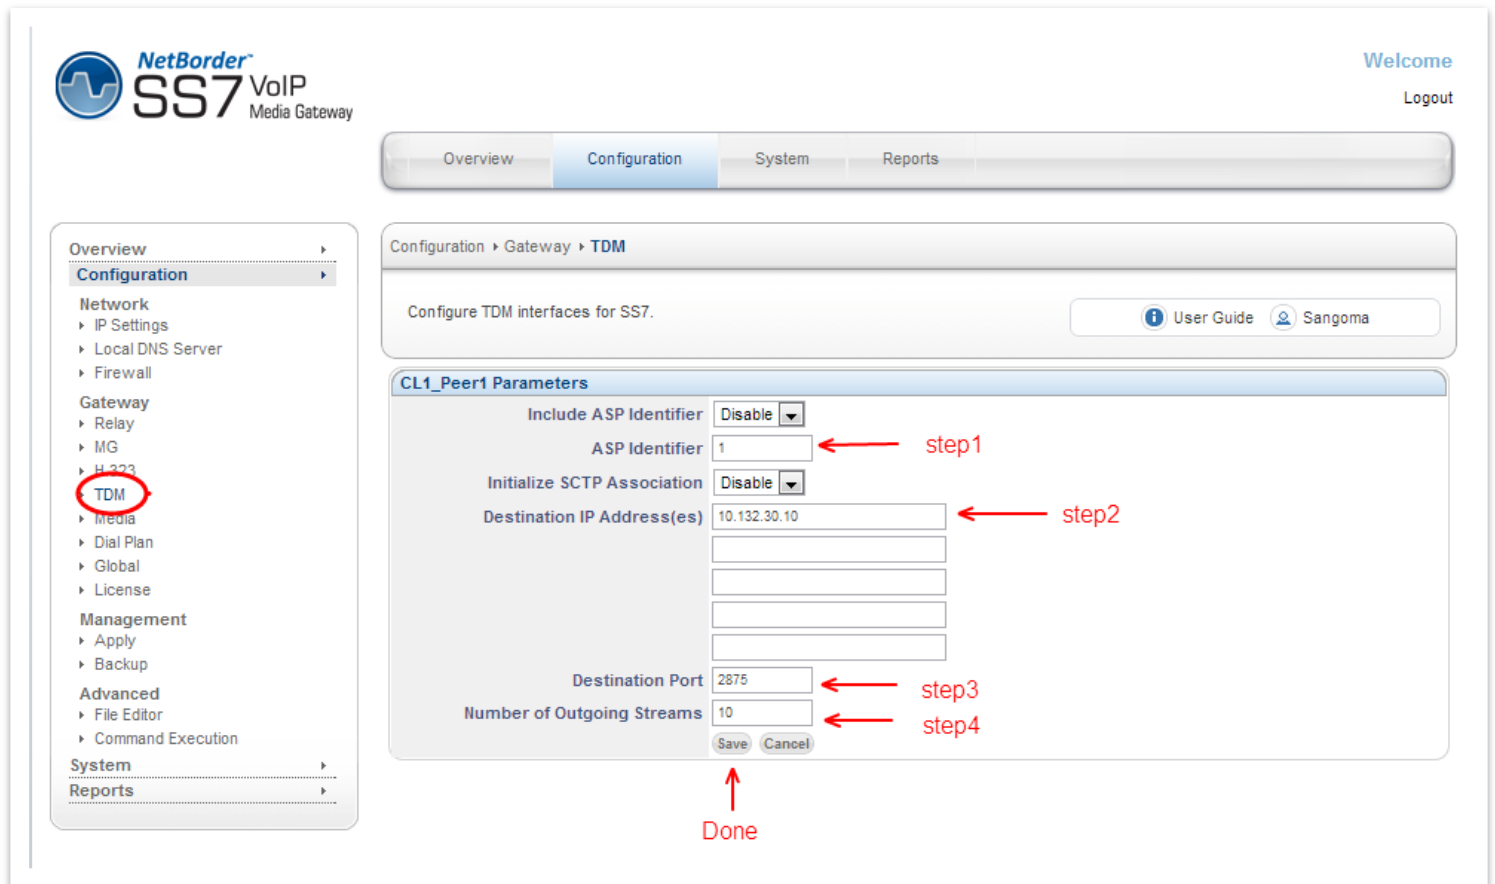

Save Cancel

Field Name	Possible Values	Default Value	Description
Traffic Mode	Load Share Override Broadcast	Load Share	This parameter defines the mode in which this Cluster is supposed to work.
Load Sharing Method	Round Robin Link Specified Customer Specified	Round Robin	This parameter defines the load share algorithm which is used to distribute the traffic

M2UA Cluster Peers

M2UA Peers will be configured under the M2UA clusters

- Select **Add** under Cluster Peers Profile
- Select **Create** Cluster Peer Profile
- Specify the Cluster Peer parameters based on provider provision document

The screenshot displays the NetBorder SS7 VoIP Media Gateway configuration interface. The left sidebar shows the navigation menu with 'TDM' highlighted under the 'Gateway' section. The main content area is titled 'Configuration > Gateway > TDM' and contains the 'CL1_Peer1 Parameters' form. The form fields are annotated with red arrows and labels indicating the configuration steps:

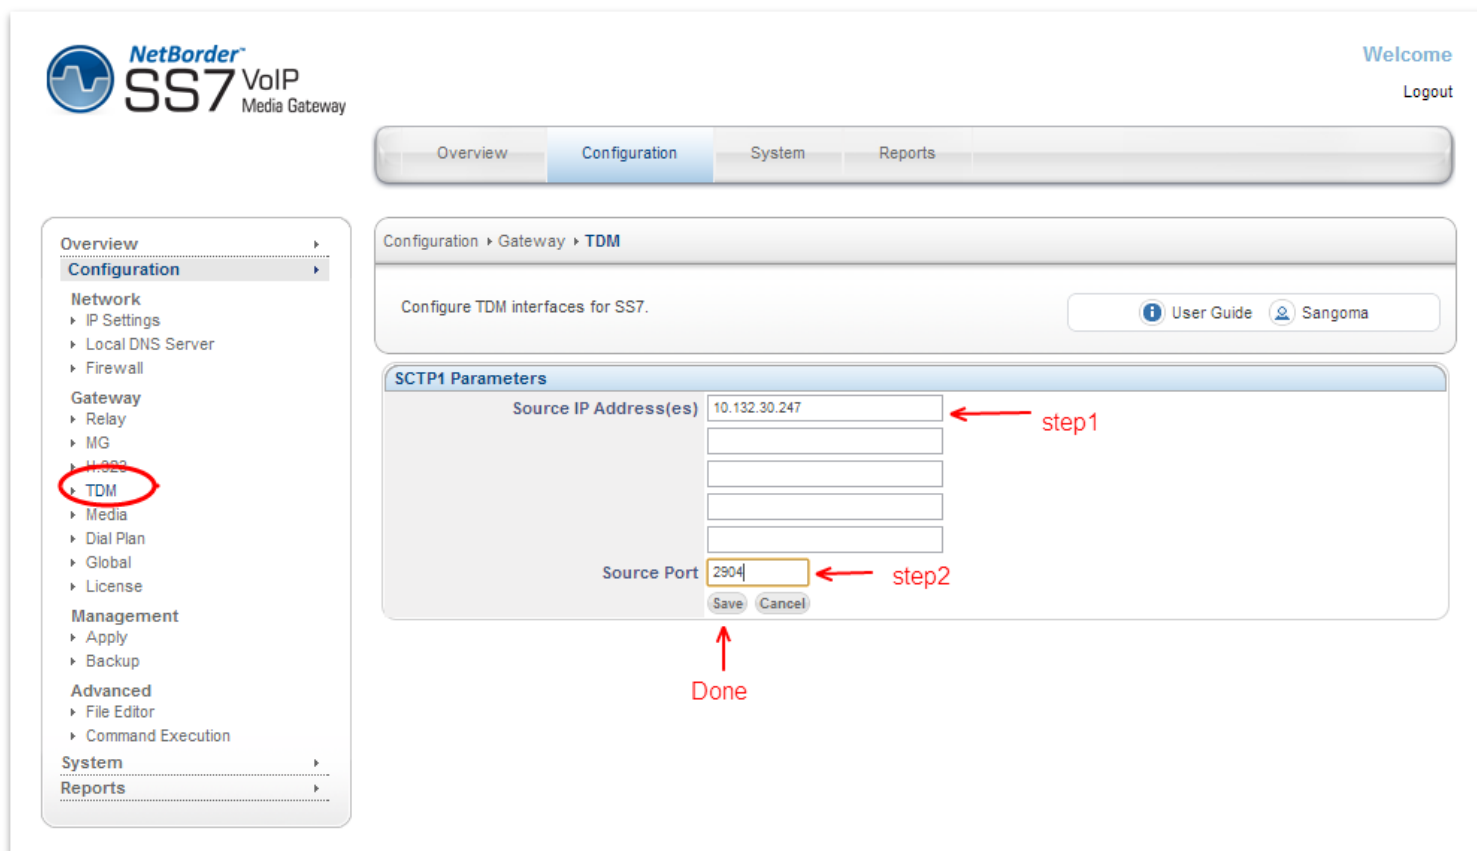

- step1**: Points to the 'ASP Identifier' field, which contains the value '1'.
- step2**: Points to the 'Destination IP Address(es)' field, which contains the value '10.132.30.10'.
- step3**: Points to the 'Destination Port' field, which contains the value '2875'.
- step4**: Points to the 'Number of Outgoing Streams' field, which contains the value '10'.

Below the form, there are 'Save' and 'Cancel' buttons. A red arrow points to the 'Done' button at the bottom center of the page.

Field Name	Possible Values	Default Value	Description
Include ASP Identifier	Disable Enable	Disable	Flag used to indicate whether include the ASP ID in the ASP UP message
ASP Identifier	NA	NA	ASP identifier for this ASP node. Set to 1 in case ASP is Disabled
Initialize SCTP Association	Disable Enable	Disable	Flag used to indicate if M2UA SG has to start SCTP association or not. If Disable means M2UA SG will wait for SCTP association request from MGC. If Enable that means M2UA SG will initiate the SCTP association request towards MGC.
Destination IP Address(es)	NA	NA	Destination IP address
Destination port	NA	NA	Destination Port
Number of Outgoing Streams	NA	10	Number of outgoing streams supported by this association. Default 10

SCTP Interface

- Select Add SCTP Interface
- Select Create SCTP Interface
- Specify SCTP Information based on provider provision document

The screenshot displays the configuration interface for the NetBorder SS7 VoIP Media Gateway. The left sidebar shows the navigation menu with 'TDM' highlighted under the 'Gateway' section. The main content area is titled 'Configuration > Gateway > TDM' and contains the 'SCTP1 Parameters' section. This section includes a 'Source IP Address(es)' field with the value '10.132.30.247' and a 'Source Port' field with the value '2904'. Red arrows labeled 'step1' and 'step2' point to these fields respectively. Below the 'Source Port' field are 'Save' and 'Cancel' buttons. A red arrow labeled 'Done' points to the 'Save' button. The top of the interface shows the 'Welcome' message and 'Logout' link, and the bottom shows the 'Sangoma' logo and 'Sangoma.com' website address.

Bind Megaco to TDM

The last step of the configuration is to bind the TDM voice channels to Megaco Profile.

The screenshot shows the Sangoma NetBorder SS7 VoIP Media Gateway configuration interface. The left sidebar contains a navigation menu with the following items: Overview, Configuration (selected), Network (with sub-items IP Settings, Local DNS Server, Firewall), Gateway (with sub-items Relay, MG, H.323, TDM (circled in red), Media, Dial Plan, Global, License), Management (with sub-items Apply, Backup), Advanced (with sub-items File Editor, Command Execution), and System. The main content area has a breadcrumb trail: Configuration > Gateway > TDM. Below this is a header bar with tabs: Overview, Configuration (active), System, and Reports. The main configuration area is titled "Media Gateway Channel Configuration" and contains a "Media Gateway Channel Profile" section with a "Profile Name" field set to "MGCHAN1". Below this is a "Profile Options" section with the following fields: "Media Gateway Profile" (a dropdown menu set to "MG_profile1", with a red arrow pointing to it and the text "megaco profile"), "Termination-ID Prefix" (a text field set to "A"), "Termination-ID Base" (a text field set to "1"), and "Channel Map" (a text field set to "1-15,s16,17-31"). At the bottom of the configuration area are two buttons: "Apply to Port" (with a red arrow pointing to it and the text "config nif and bind voice channels to megaco") and "Cancel Configuration".

- Proceed to the next section, or
- If finished all gateway configuration, proceed to Apply to generate configs.

7. SIP Endpoint Configuration

To access VoIP: SIP configuration section

- Select **Global** from side/top **Configuration** Menu
- Change a SIP global variable and Click on Save (Disk Icon)
- Proceed to Control Panel and Restart the VoIP Gateway.

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration' (selected), 'System', and 'Reports'. The breadcrumb trail shows 'Configuration > Gateway > Global'. Below this, a message states 'Configure Netborder SS7 VoIP Media Gateway global configuration settings.' with links to 'User Guide' and 'Sangoma'.

The main content area shows an XML configuration file. The 'SIP settings' section is circled in red, containing the following configuration:

```
<!-- SIP settings -->
<X-PRE-PROCESS cmd="set" data="sip_port=5062"/>
<X-PRE-PROCESS cmd="set" data="sip_ip=${local_ip_v4}"/>
<!-- DTMF type values: info, rfc2833 or none -->
<X-PRE-PROCESS cmd="set" data="sip_dtmf_type=rfc2833"/>
<!-- Payload type if using rfc2833 for DTMF -->
<X-PRE-PROCESS cmd="set" data="rfc2833_pt=101"/>
<X-PRE-PROCESS cmd="set" data="sip_user_agent=Netborder SS7 to VoIP Media Gateway 4.0"/>
```

Below the SIP settings, the 'RTP settings' section is also circled in red:

```
<!-- RTP settings -->
<X-PRE-PROCESS cmd="set" data="rtp_start_port=21000"/>
<X-PRE-PROCESS cmd="set" data="rtp_end_port=31000"/>
```

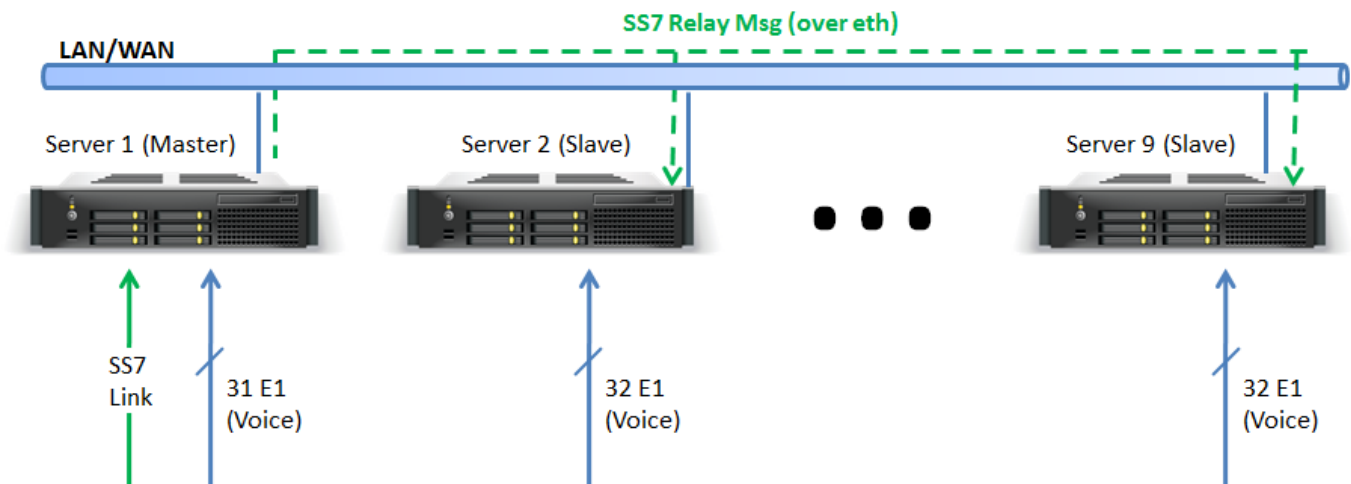

The bottom status bar shows 'Position: Ln 1, Ch 1' and 'Total: Ln 38, Ch 1529'.

<i>Field Name</i>	<i>Possible Values</i>	<i>Default Value</i>	<i>Description</i>
gwuser	Any string	sangoma	NSG SIP incoming registration authentication user name.
gwpass	Any string	sangoma	NSG SIP incoming registration authentication password
outbound_caller_name	Any string	Netborder SS7 to VoIP Media Gateway	Global caller id name defaults (used if no caller id name is present on the call) for both PSTN and SIP
outbound_caller_id	Any digits	9054741990	Global caller id defaults (used if no caller id is present on the call) for both PSTN and SIP
sip_port	Any port number	5062	SIP service port number.
sip_ip	Any ip address	System IP	SIP service IP address. By default a system eth0 address is taken as default ip address.
sip_dtmf_type	rfc2833 info none	rfc2833	rfc2833 - DTMF passed via RTP oob message info - DTMF passed via SIP INFO message none - DTMF passed via inband media
rfc2833_pt	Any number	101	rfc2833 rtp payload type override. Ability to set the RTP payload type for rfc2833. Use d edge cases where remote equipment is not per spec.
sip_user_agent	Any string	Netborder SS7 to VoIP Media Gateway 4.0	SIP INVITE user agent name string.
rtp_start_port	Any port	21000	RTP port starting range value. NSG will pick RTP ports for each call within this range.
rtp_end_port	Any port	31000	RTP port stop range value. NSG will pick RTP ports for each call within this range
pstn_default_group	g1,g2,g3,g4	g1	Default pstn dial group number, in case the group is not specified in the dial string.
radius_auth_host	Any ip address:port	10.199.0.3:1812	Location of the Radius server, that will be used to authenticate incoming calls.
radius_auth_secret	Any string	testing123	Password of the remote Radius server.
radius_cdr_host	Any ip address:port	10.199.0.3:1812	Location of the Radius server, that will be used to keep track of billing via CDRs.
radius_auth_secret	Any string	testing123	Password of the remote Radius server.

8. Relay: SS7

NSG SS7 relay enables a single NSG server (master) to control multiple NSG servers (slaves) with as little as 1 signaling link connected to the master.

You can have up to 8 slave machines that are controlled by a single master server. Signaling messages (MTP2 traffic) are passed over the IP network to the slave machines.

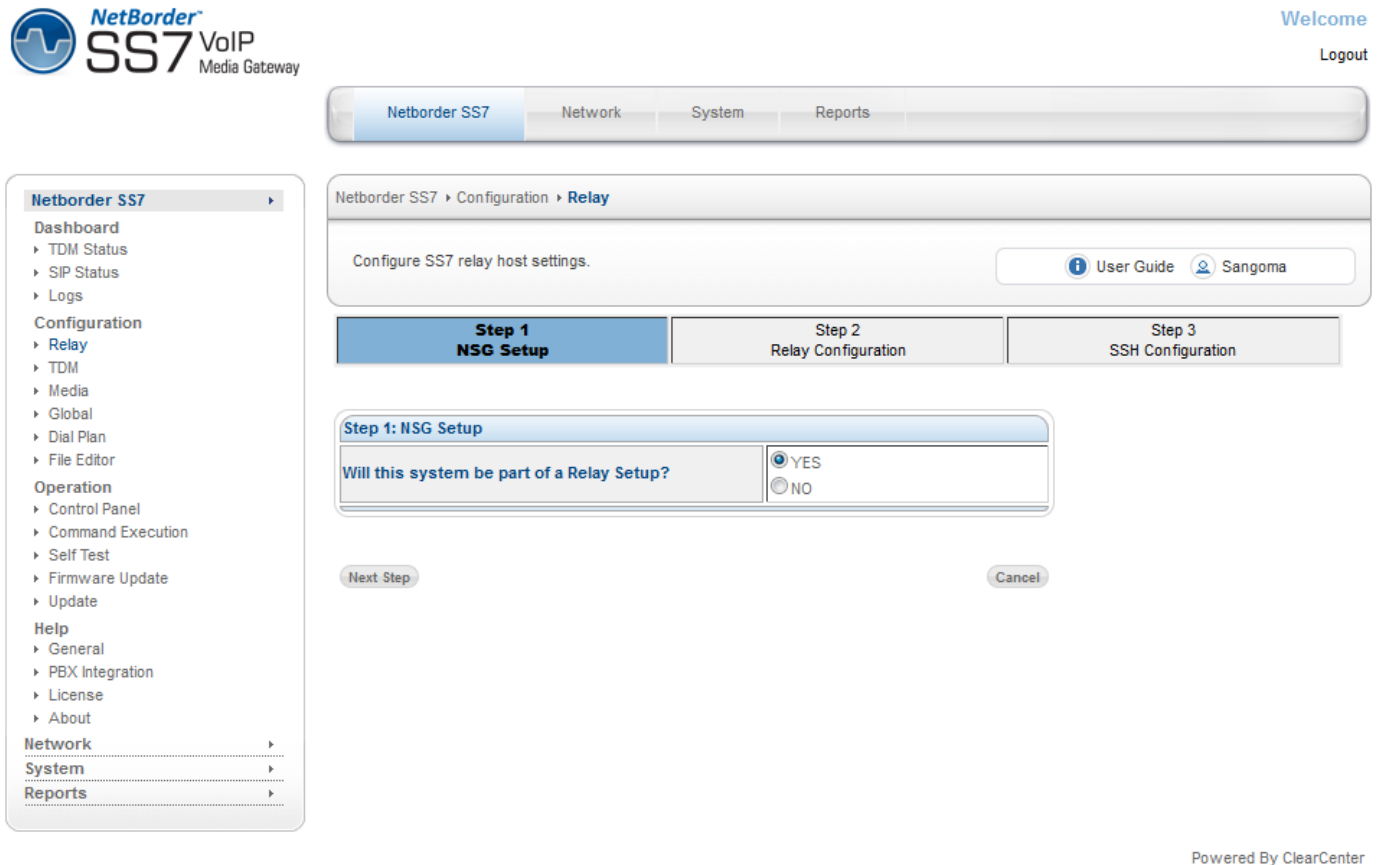

Having to configure up to 8 machines individually would be a tedious task from an operations perspective. In order to simplify the configuration process of this distributed system, the relay option enables the Master server to configure all the slaves machine from its web UI and pushing the configurations to the slave servers over SSH.

This following section will guide you through the configuration of the Relay mode to enable remote control of the Slave servers.

Relay Configuration

To access the Relay: SS7 configuration section

1. Select **Relay** from side/top **Configuration** Menu

The screenshot displays the NetBorder SS7 VoIP Media Gateway configuration interface. The top navigation bar includes 'Netborder SS7', 'Network', 'System', and 'Reports'. The left sidebar menu is expanded to 'Configuration' > 'Relay'. The main content area shows the 'Relay' configuration page with the title 'Configure SS7 relay host settings.' and links for 'User Guide' and 'Sangoma'. Below the title is a progress bar with three steps: 'Step 1 NSG Setup' (active), 'Step 2 Relay Configuration', and 'Step 3 SSH Configuration'. The 'Step 1: NSG Setup' section contains a question: 'Will this system be part of a Relay Setup?' with radio button options for 'YES' (selected) and 'NO'. At the bottom of the step are 'Next Step' and 'Cancel' buttons. The footer of the interface indicates 'Powered By ClearCenter'.

- Select **No** if you do not want to enable Relay mode in your installation and proceed to the next [section](#) to resume SS7 configuration.
- Select **Yes** to activate the relay Mode

Configuring the master server

We will start by configuring the master machine first.

Key management

Re-Generate a new key
Download

Once the SSH key has been generated you will need to click on the "Add New Host" button to add 1 or more slave servers to the relay configuration.

The listening relay port for all subsequent slave instances will increase by 1 port. Slave on node 2 will listen on port 5001, Slave on node 3 will listen on port 5002, etc...

Once you have configured all your slave hosts, you can now configure your slave machine(s)

Configuring the slave server

To access the Relay: SS7 configuration section

1. Select **Relay** from side/top **Configuration** Menu

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Netborder SS7', 'Network', 'System', and 'Reports'. The left sidebar menu is expanded to 'Configuration' > 'Relay'. The main content area shows 'Netborder SS7 > Configuration > Relay' and 'Configure SS7 relay host settings.' with links for 'User Guide' and 'Sangoma'. Below this, a progress bar indicates three steps: 'Step 1 NSG Setup' (active), 'Step 2 Relay Configuration', and 'Step 3 SSH Configuration'. The 'Step 1: NSG Setup' section contains the question 'Will this system be part of a Relay Setup?' with radio buttons for 'YES' (selected) and 'NO'. 'Next Step' and 'Cancel' buttons are at the bottom. The footer notes 'Powered By ClearCenter'.

Select Yes in step 1 to enable Relay mode.

Once the key has been uploaded, the SSH link will have been enabled.

Repeat these steps for all the slave machines and return to the master web gui when you are finished

Configuring the slave TDM configurations from the master server

Open the master web gui in your browser.

1. Select **TDM** from side/top Configuration Menu

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Netborder SS7', 'Network', 'System', and 'Reports'. The left sidebar menu is expanded to 'Configuration' > 'TDM'. The main content area shows the 'TDM' configuration page with a breadcrumb 'Netborder SS7 > Configuration > TDM'. Below the breadcrumb, there is a section for 'Configure TDM interfaces for SS7.' with links for 'User Guide' and 'Sangoma'. A configuration status box indicates that TDM information was last refreshed on Tuesday 13th of December 2011 07:28:45 PM. The page features two tabs: '1 - Master' and '2 - Slave'. The '2 - Slave' tab is selected, showing a list of 'T1/E1/J1 Cards'. There are four cards listed, each with a title bar (e.g., 'AFT-A108-SH Port 1 Card 1 [HWEC=256, V44]') and a 'Physical Config' section with 'Identify' and 'Edit' buttons. A 'Clear' button is also present in the top right of each card's title bar.

The TDM configuration is presented in a tabbed pane, each tab represents a machine to configure. Select the slave tab to configure the slave server.

Once you have completed configuring the master and slave(s) TDM configurations, you will click on the "Generate config" button that will push the configuration to each slave over a secure SSH connection. All this is done from the convenience of the master server's web gui, removing the need to log on to each slave server's web gui individually.

9. Applying Configuration

The changes made in the **Configuration** section of the WebUI are only stored on the scratch disk. User **MUST** proceed to Apply page in the Management Section to save new configuration.

- Select **Apply** from side/top **Configuration** Menu
- Visually confirm the warnings
 - License warning need to be resolved with Sales
- Select **Generate Config** to apply the configuration to file/disk.
 - Generate Config will generate all necessary NSG SS7 VoIP Gateway configuration files needed to successfully start the NSG gateway.

35                 <action application="set" data="fax_enable_t38=true" />
36             </condition>
37         </extension>
38     </context>
39 </include>
```

Position: Ln 1, Ch 1 Total: Ln 92, Ch 3870

Dialplan is pre-configured for

- SIP to TDM and TDM to SIP Bridging.
Section "from-sip" routes calls from SIP to PSTN/SS7
Section "from-pstn" routes calls from PSTN/SS7 to SIP.
- H323 to TDM and TDM to H323 Bridging
Section "from-h323" routes calls from H323 to PSTN

Dialplan Reload/Apply

Note that Dialplan can be modified in real time without the need to restart the gateway.

Once you Save the Dialplan, you will be prompted to Reload the gateway which will apply the changes without any service interrupt. All the currently established calls will not be affected. Only the newly established calls will start using the new dialplan rules.

PSTN to SIP Dialplan

```
<context name="from-pstn">
  <extension name="to-h323">
    <!-- handle the case where there might not be destination number at all -->
    <condition field="destination_number" expression="^\{1,\}$" break="never">
      <action application="set" data="destnumber=$1"/>
      <anti-action application="set" data="destnumber=unknown"/>
    </condition>

    <!-- Dial to the gateway user (it may ring multiple registrations, first answer wins) -->
    <condition field="destination_number" expression="^\{.*\}$">

      <action application="set" data="hangup_after_bridge=yes" />
      <action application="bridge" data="opal/h323:${destination_number}@${h323_remote_ip}"/>

      <!-- uncomment this if you want to dial to a fixed IP addr -->
      <!-- <action application="bridge" data="sofia/internal:${destnumber}@192.168.1.1"/> -->
    </condition>
  </extension>

  <extension name="to-sip">
    <!-- handle the case where there might not be destination number at all -->
    <condition field="destination_number" expression="^\{1,\}$" break="never">
      <action application="set" data="destnumber=$1"/>
      <anti-action application="set" data="destnumber=unknown"/>
    </condition>

    <!-- Dial to the gateway user (it may ring multiple registrations, first answer wins) -->
    <condition field="destination_number" expression="^\{.*\}$">

      <action application="set" data="hangup_after_bridge=yes" />
      <action application="set" data="tone_detect_hits=1" />
      <action application="set" data="fax_enable_t38_request=true" />
      <action application="set" data="fax_enable_t38=true" />
      <action application="set" data="execute_on_answer=t38_gateway_peer cng" />

      <action application="set" data="sip_contact_user_replacement=${destnumber}"/>

      <action application="set" data="hangup_after_bridge=yes"/>

      <!-- Bridge call to a registered SIP UA. Comment if you want to bridge to IP -->
      <action application="bridge" data="${sofia_contact(${gwuser}@${domain})}"/>
      <!-- Uncomment this if you want to dial to a fixed IP addr -->
      <!-- <action application="bridge" data="sofia/internal:${destnumber}@192.168.1.1"/> -->

      <action application="hangup" data="${originate_disposition}"/>
    </condition>
  </extension>
</context>
```

By default NSG is setup to accept SIP registrations. All calls coming from PSTN would be passed to a registered SIP User Agent.

If you would like NSG to send SIP requests to a specific address, you must uncomment the above line with blue arrow. And comment the line above it.

Then insert your own IP address instead of the 192.168.1.1 which is there as a example.

SIP to PSTN Dialplan

```
<context name="from-sip">
  <extension name="to-pstn">
    <!-- retrieve group and hunting parameters if present -->
    <condition field="destination_number" expression="([0-9a-zA-Z]+)(-g=[a-zA-Z0-9+]?(-h=[a|A])?(-fax)?"
break="never">
      <action inline="true" application="set" data="group=$2"/>
      <action inline="true" application="set" data="hunting=$3"/>
      <action inline="true" application="set" data="faxcall=$4"/>
    </condition>
    <!-- check if there is a group and set a default if not present -->
    <condition field="{group}" expression="^-g=([a-zA-Z0-9+])$" break="never">
      <action application="set" data="group=$1"/>
      <anti-action application="set" data="group=${psstn_default_group}"/>
    </condition>
    <!-- check if there is a hunting policy and set a default if not present -->
    <condition field="{hunting}" expression="^-h=([a|A])$" break="never">
      <action application="set" data="hunting=$1"/>
      <anti-action application="set" data="hunting=${psstn_default_hunting}"/>
    </condition>
    <!-- Do the actual pstn dialing -->
    <condition field="destination_number" expression="^[0-9a-zA-Z]+$">
      <action application="set" data="hangup_after_bridge=yes" />
      <action application="answer" />
      <action application="export" data="nolocal:tone_detect_hits=10" />
      <action application="set" data="fax_enable_t38_request=true" />
      <action application="set" data="fax_enable_t38=true" />
      <action application="export" data="nolocal:execute_on_answer=t38_gateway peer
ced_preamble" />
      <action application="set" data="hangup_after_bridge=yes"/>
      <action application="bridge" data="freedm/${group}/${hunting}/${1}"/>
      <action application="hangup" data="${originate_disposition}"/>
    </condition>
  </extension>
</context>
```

Dialplan Syntax

There are several elements used to build an XML dialplan. In general, the dialplan groups logically similar functions and calling activities into a 'context'. Within a context are extensions, each with 'condition' rules and associated 'actions' to perform when the condition rules match.

The following is a sample dialplan to illustrate these concepts. We have left out the XML "wrapper" to help make the basic concepts more clear:

```
<context name="example">
  <extension name="500">
    <condition field="destination_number" expression="^500$">
      <action application="bridge" data="user/500"/>
    </condition>
  </extension>

  <extension name="501">
    <condition field="destination_number" expression="^501$">
      <action application="bridge" data="user/501"/>
      <action application="answer"/>
      <action application="sleep" data="1000"/>
      <action application="bridge" data="loopback/app=voicemail:default ${domain_name} ${dialed_extension}"/>
    </condition>
  </extension>
</context>
```

Each rule is processed in order until you reach the action tag which tells NSG what action to perform. You are not limited to only one condition or action tag for a given extension.

In our above example, a call to extension 501 rings the extensions. If the user does not answer, the second action answers the call, and following actions delay for 1000 milliseconds (which is 1 second) and connect the call to the voicemail system.

Context

Contexts are a logical grouping of extensions. You may have multiple extensions contained within a single context.

The context tag has a required parameter of 'name'. There is one reserved name, any, which matches any context. The name is used by incoming call handlers (like the [Sofia] SIP driver) to select the dialplan that runs when it needs to route a call. There is often more than one context in a dialplan.

A fully qualified context definition is shown below. Typically you'll not need all the trimmings, but they are shown here for completeness.

```
<?xml version="1.0"?>
<document type="freeswitch/xml">
  <section name="dialplan" description="Regex/XML Dialplan">
    <!-- the default context is a safe start -->
    <context name="default">
      <!-- one or more extension tags -->
    </context>
    <!-- more optional contexts -->
  </section>
</document>
```

Extensions

Extensions are destinations for a call. This is the meat of NSG routing dialed numbers. They are given a name and contain a group of conditions, that if met, will execute certain actions.

A 'name' parameter is required: It must be a unique name assigned to an extension for identification and later use.

For example:

```
<extension name="Your extension name here">
  <condition(s)...
    <action(s) .../>
  </condition>
</extension>
```

NOTE: Typically when an extension is matched in your dialplan, the corresponding actions are performed and dialplan processing stops. An optional `continue` parameter allows your dialplan to continue running.

```
<extension name="500" continue="true">
```

Conditions

Dialplan conditions are typically used to match a destination number to an extension. They have, however, much more power than may appear on the surface.

NSG has a set of built-in variables used for testing. In this example, the built-in variable `destination_number` is compared against the regular expression `^500$`. This comparison is 'true' if `<destination_number>` is set to 500.

```
<extension name="500">
  <condition field="destination_number" expression="^500$">
    <action application="bridge" data="user/500"/>
  </condition>
</extension>
```

Each condition is parsed with the Perl Compatible Regular Expression library. (go [here](#) for PCRE syntax information).

If a regular expression contains any terms wrapped in parentheses, and the expression matches, the variables `$1`, `$2`..`$N` will be set to the matching contents within the parenthesis, and may be used in subsequent action tags within this extension's block.

For example, this simple expression matches a four digit extension number, and captures the last two digits into `$1`.

```
<condition field="destination_number" expression="^\d\d(\d\d)$">
  <action application="bridge" data="sofia/internal/$1@example.com"/>
</condition>
```

A destination number of 3425 would set `$1` to 25 and then bridge the call to the phone at `25@example.com`

Multiple Conditions (Logical AND)

You can emulate the logical AND operation available in many programming languages using multiple conditions. When you place more than one condition in an extension, *all* conditions must match before the actions will be executed. For example, this block will only execute the actions if the destination number is 500 *AND* it is Sunday.

```
<condition field="destination_number" expression="^500$"/>
<condition wday="1">
  action(s) ...
</condition>
```

Keep in mind that you must observe correct XML syntax when using this structure. Be sure to close all conditions *except the last one* with `/>`. The last condition contains the final actions to be run, and is closed on the line after the last action.

By default, if any condition is false, NSG will move on to the anti-actions or the next extension without even evaluating any more conditions.

Multiple Conditions (Logical OR, XOR)

It is possible to emulate the logical OR operation available in many programming languages, using multiple conditions. In this situation, if one of the conditions matches, the actions are executed. For example, this block executes its actions if the destination number is 501 *OR* the destination number is 502.

```
<condition field="destination_number" expression="^501|502$">
  action(s)...
</condition>
```

This method works well if your OR condition is for the same field. However, if you need to use two or more different fields then use the new **regex** syntax

```
<extension name="Regex OR example 1" continue="true">
  <condition regex="any">
    <!-- If either of these is true then the subsequent actions are added to execute list -->
    <regex field="caller_id_name" expression="Some User"/>
    <regex field="caller_id_number" expression="^1001$"/>
    <action application="log" data="INFO At least one of the conditions matched!"/>
    <!-- If *none* of the regexes is true then the anti-actions are added to the execute list -->
    <anti-action application="log" data="WARNING None of the conditions matched!"/>
  </condition>
</extension>
```

Using this method it becomes easier to match the caller's name OR caller ID number and execute actions whether either is true.

A slightly more advanced use of this method is demonstrated here:

```
<extension name="Regex OR example 2" continue="true">
  <condition regex="any" break="never">
    <regex field="caller_id_name" expression="^Michael\s*S?\s*Collins"/>
    <regex field="caller_id_number" expression="^1001|3757|2816$"/>
    <action application="set" data="calling_user=mercutioviz" inline="true"/>
    <anti-action application="set" data="calling_user=loser" inline="true"/>
  </condition>

  <condition>
    <action application="answer"/>
  </condition>
</extension>
```

```
<action application="sleep" data="500"/>
<action application="playback" data="ivr/ivr-welcome_to_freeswitch.wav"/>
<action application="sleep" data="500"/>
</condition>

<condition field="${calling_user}" expression="^loser$">
  <action application="playback" data="ivr/ivr-dude_you_suck.wav"/>
  <anti-action application="playback" data="ivr/ivr-dude_you_rock.wav"/>
</condition>
</extension>
<extension name="Regex XOR example 3" continue="true">
  <condition regex="xor">
    <!-- If only one of these is true then the subsequent actions are added to execute list -->
    <regex field="caller_id_name" expression="Some User"/>
    <regex field="caller_id_number" expression="^1001$"/>
    <action application="log" data="INFO Only one of the conditions matched!"/>
    <!-- If *none* of the regexes is true then the anti-actions are added to the execute list -->
    <anti-action application="log" data="WARNING None of the conditions matched!"/>
  </condition>
</extension>
```

Basically, for this new syntax you can have a condition to have a "regex" attr instead of "field" and "expression" etc. When there is a "regex" attr, that means you plan to have one or more <regex> tags that are similar to the condition tag itself that it has field and expression in it.

The value of the "regex" attr is either "all" or "any" or "xor" indicating if all expressions must match or just any expression or only one must match(xor) . If it's set to "any" it will stop testing the regex tags as soon as it finds one match, if it is set to "all", it will stop as soon as it finds one failure.

From there it will behave like a normal condition tag either executing the actions or anti-actions and breaking based on the "break" attr.

The basic difference here is once there is a "regex" attr, the <regex> tags parsed for "all" or "any" take the place of the single "field" and "condition"

NOTE: Also, if any captures are done in the "expression" attrs of a <regex> tag, only the data from the newest capture encountered will be considered in the \$n expansion or FIELD_DATA creation. In addition, you can set DP_REGEX_MATCH_1 .. DP_REGEX_MATCH_N to preserve captures into arrays.

```
<extension name="Inbound_external">
```

```
<condition regex="any">
  <regex field="{sip_from_host}" expression="domainA"/>
  <regex field="{sip_from_uri}" expression="1234567890@domainB"/>
  <regex field="{sip_from_uri}" expression="user@domainC"/>
  <regex field="caller_id_name" expression="^(John Smith)$"/>
  <regex field="caller_id_number" expression="^(55512341)|(55512342)|(55512343)$"/>

  <action application="set" data="domain_name=domainZ"/>
  <action application="transfer" data="{destination_number} XML domainZ"/>
</condition>
</extension>
```

This is another example to show that all regex conditions must be true, then the action will get executed; otherwise, the anti-action will. This is the same logic as follows:

```
IF (cond1 AND cond2 AND cond3) THEN
do actions
ELSE
do other actions
ENDIF
```

Basically, the `<condition regex="all">` tells the parser, "Hey, execute the `<action>`'s only if all regexes PASS, otherwise execute any `<anti-action>`'s".

```
<condition regex="all">
<regex field="{sip_gateway}" expression="^{default_provider}$"/>
<regex field="{emergency_call}" expression="^true$"/>
<regex field="{db(select/emergency/autoanswer)}" expression="^1$"/>

<!-- the following actions get executed if all regexes PASS -->
<action application="set" data="call_timeout=60"/>
<action application="set" data="effective_caller_id_name={regex({caller_id_name}|^Emerg(.*?)$|Auto%1)}"/>
<action application="set" data="autoanswered=true"/>
<action application="bridge" data="user/1000@{domain_name},sofia/gateway/1006_7217/{mobile_number}"/>

<!-- the following anti-actions are executed if any of the regexes FAIL -->
<anti-action application="set" data="effective_caller_id_name={regex({caller_id_name}|^Emerg(.*?)$|NotAuto%1)}"/>
<anti-action application="set" data="call_timeout=30"/>
<anti-action application="set" data="autoanswered=false"/>
```

```
<anti-action application="bridge" data="user/1000@${domain_name},sofia/gateway/1006_7217/${mobile_number}"/>
</condition>
```

Complex Condition/Action Rules

Here is a more complex example, performing time-based routing for a support organization. The user dials extension 1100. The actual support extension is 1105 and is staffed every day from 8am to 10pm, except Friday, when it is staffed between 8am and 1pm. At all other times, calls to 1100 are sent to the support after-hours mailbox.

```
<extension name="Time-of-day-tod">
  <!--if this is false, FreeSWITCH skips to the next *extension*.-->
  <condition field="destination_number" expression="^1100$" break="on-false"/>

  <!--Don't bother evaluating the next condition set if this is true.-->
  <condition wday="6" hour="8-12" break="on-true">  <!--Fri, 8am-12:59pm-->
    <action application="transfer" data="1105 XML default"/>
  </condition>

  <condition wday="1-5" hour="8-21" break="on-true">  <!--Sunday-Thursday, 8am-9:59pm-->
    <action application="transfer" data="1105 XML default"/>
  </condition>

  <condition> <!--this is a catch all, sending the call to voicemail at all other times. -->
    <action application="voicemail" data="default ${domain} 1105"/>
  </condition>
</extension>
```

In this example, we use the `break=never` parameter to cause the first condition to 'fall-through' to the next condition no matter if the first condition is true or false. This is useful to set certain flags as part

of extension processing. This example sets the variable `begins_with_one` if the destination number begins with 1.

```
<extension name="break-demo">
  <!-- because break=never is set, even when the destination does not begin
        with 1, we skip the action and keep going -->
  <condition field="destination_number" expression="^1(\d+)$" break="never">
    <action application="set" data="begins_with_one=true"/>
  </condition>

  <condition field="destination_number" expression="^(1\d+)$">
    ...other actions that may query begins_with_one...
  </condition>
</extension>
```

Variables

Condition statements can match against channel variables, or against an array of built in variables.

Built-In Variables

The following variables, called 'caller profile fields', can be accessed from condition statements directly:

- **context** Why can we use the context as a field? Give us examples of usages please.
- **rdnis** Redirected Number, the directory number to which the call was last presented.
- **destination_number** Called Number, the number this call is trying to reach (within a given context)
- **dialplan** Name of the dialplan module that are used, the name is provided by each dialplan module. Example: XML
- **caller_id_name** Name of the caller (provided by the User Agent that has called us).
- **caller_id_number** Directory Number of the party who called (caller) -- can be masked (hidden)
- **ani** Automatic Number Identification, the number of the calling party (caller) -- cannot be masked
- **aniii** The type of device placing the call [ANI2](#)
- **uuid** Unique identifier of the current call? (looks like a GUID)
- **source** Name of the FreeSWITCH module that received the call (e.g. PortAudio)
- **chan_name** Name of the current channel (Example: PortAudio/1234). Give us examples when this one can be used.
- **network_addr** IP address of the signaling source for a VoIP call.
- **year** Calendar year, 0-9999
- **yday** Day of year, 1-366
- **mon** Month, 1-12 (Jan = 1, etc.)
- **mday** Day of month, 1-31
- **week** Week of year, 1-53
- **mweek** Week of month, 1-6
- **wday** Day of week, 1-7 (Sun = 1, Mon = 2, etc.) or "sun", "mon", "tue", etc.
- **hour** Hour, 0-23
- **minute** Minute (of the hour), 0-59
- **minute-of-day** Minute of the day, (1-1440) (midnight = 1, 1am = 60, noon = 720, etc.)
- **time-of-day** Time range formatted: hh:mm[:ss]-hh:mm[:ss] (seconds optional) Example: "08:00-17:00"
- **date-time** Date/time range formatted: YYYY-MM-DD hh:mm[:ss]~YYYY-MM-DD hh:mm[:ss] (seconds optional, note tilde between dates) Example: 2010-10-01 00:00:01~2010-10-15 23:59:59

For example:

```
<condition field="network_addr" expression="^192\.\168\.\1\.\1$"/> <!-- network address=192.168.1.1 >
<condition mon="2"> <!-- month=February -->
```

Caller Profile Fields vs. Channel Variables

One thing that may seem confusing is the distinction between a [caller profile field](#) (the built-in variables) and a channel variable.

Caller profile fields are accessed like this:

```
<condition field="destination_number" attributes...>
```

While channel variables are accessed like this:

```
<condition field="${sip_has_crypto}" attributes...>
```

Please take note of the **\${variable_name}** syntax. Channel variables may also be used in action statements. In addition, API functions can be called from inside a condition statement to provide dynamic data.

For example, you can use the **cond** API:

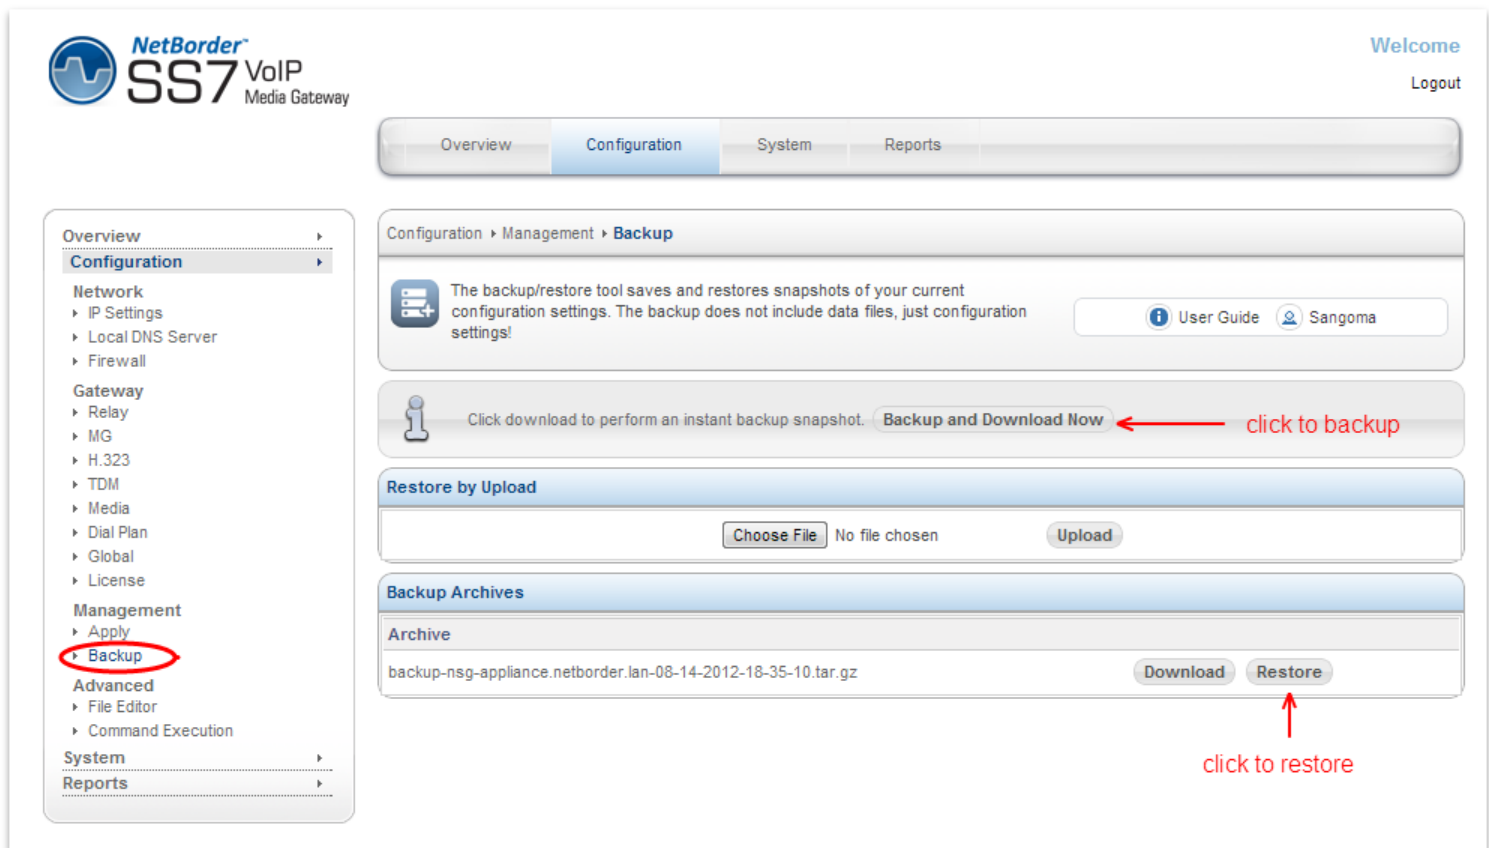

```
<condition field="${cond(${my_var} > 12 ? YES : NO)}" expression="^YES$">
  <action application="log" data="INFO ${my_var} is indeed greater than 12"/>
</condition>
```

This example tests **\${my_var}**. If it is more than 12, "YES" is returned. Otherwise "NO" is returned. The condition tests the results for "YES" and logs the resulting message to the NSG log.

11. Backup Restore System

Appliance configuration can be backed up to a zipped file.
Appliance can be restored from a same file.

- Select **Backup** from side/top **Configuration** Menu
- Click on Backup and Download Now
 - Note that a backup will be offered for download as well as stored locally on the system.
 - Note the Backup Archive shows previous backups that can be used to restore the system.

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration' (selected), 'System', and 'Reports'. The left sidebar menu shows 'Configuration' expanded, with 'Backup' highlighted by a red circle. The main content area is titled 'Configuration > Management > Backup'. It contains a description of the backup/restore tool, a 'Backup and Download Now' button (indicated by a red arrow and 'click to backup'), a 'Restore by Upload' section with a 'Choose File' button, and a 'Backup Archives' table. The table lists a backup file 'backup-nsg-appliance.netborder.lan-08-14-2012-18-35-10.tar.gz' with 'Download' and 'Restore' buttons. A red arrow points to the 'Restore' button with the text 'click to restore'.

12. Factory Reset & Reboot

Factory Reset

- Find a power button in front of the NSG Server
- Press the power button repeatedly fast (every 1 sec) for 10 sec.
- On factory reset trigger, the system will be restored to factory settings and the system will reboot.

Server Reboot

- Find a power button in front of the NSG Server
- Press the power button three times with more than 2sec delay in between..
 - Press power button
 - Count to 3
 - Press power button
 - Count to 3
 - Press power button
- When there were 5 power button presses within 5sec the NSG System will revert to factory defaults.

Server Shutdown

- Find a power button in front of the NSG Server
- Press the power button and hold it until machine shutdown.

14. Upgrade

User has two choices when upgrading NSG system.

- WebUI Update Page
- Manual Console Update via SSH

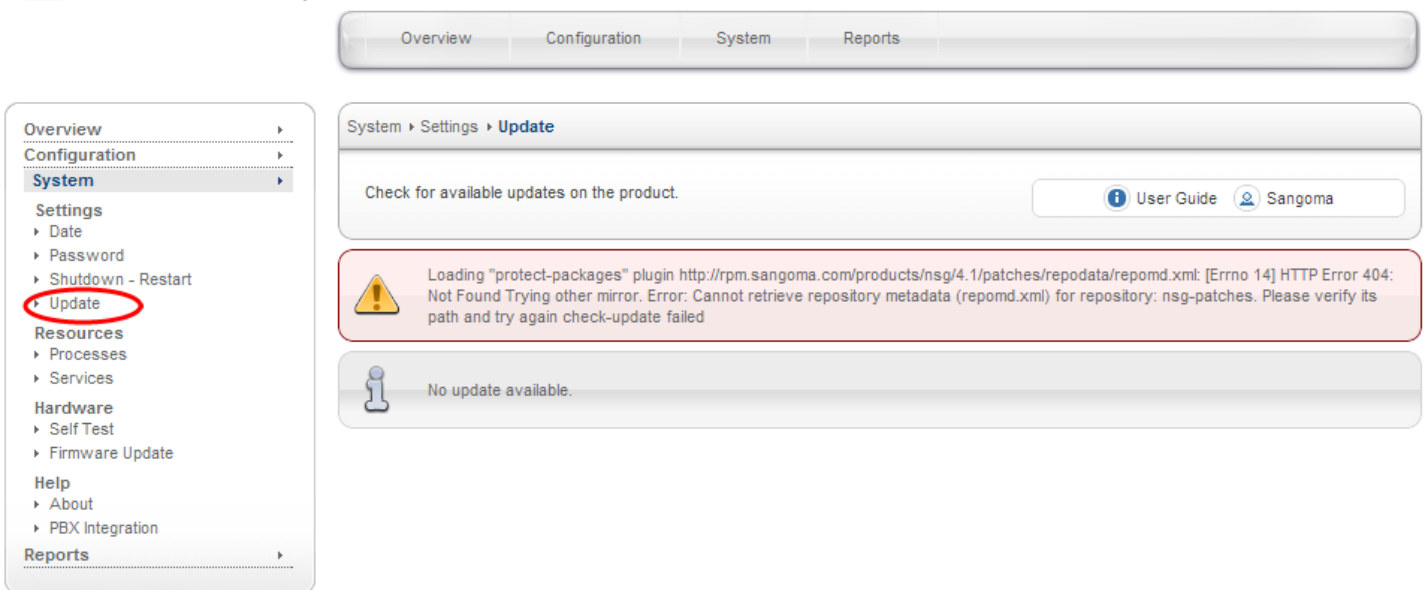

WebUI System Update

- Select **Update** from side/top **System** Menu
- Review available packages for upgrade.
- Proceed with the upgrade process

Welcome

Logout

Overview Configuration System Reports

System > Settings > **Update**

Check for available updates on the product. [User Guide](#) [Sangoma](#)

 Loading "protect-packages" plugin http://rpm.sangoma.com/products/nsg/4.1/patches/repodata/repomd.xml: [Errno 14] HTTP Error 404: Not Found Trying other mirror. Error: Cannot retrieve repository metadata (repomd.xml) for repository: nsg-patches. Please verify its path and try again check-update failed

 No update available.

Console SSH Update

NSG product uses Linux RPM as part of its package management system.

- Download new NSG RPM version
- Stop NSG services
 - User the GUI Control Panel
 - Alternatively run:
 - `services nsg stop`
 - `services nsg-webui stop`
- Install new package
 - `rpm -Uvh nsg-4.3.1.rpm`
- Restart NSG services
 - Use the GUI Control Panel
 - Alternatively run:
 - `services nsg-webui start`
 - `services nsg start`

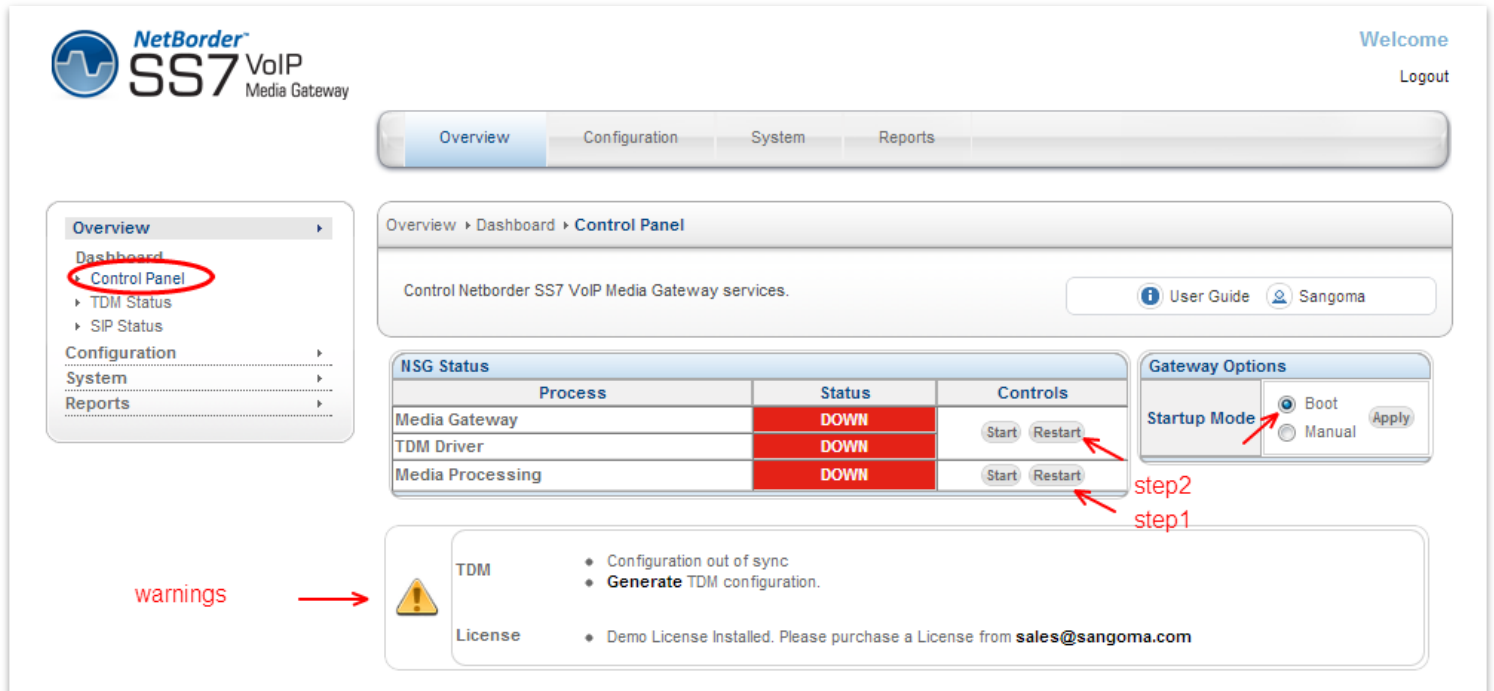

NOTE

Using NSG console to upgrade the system is very powerful, as the process can be scripted and centralized. This way all NSG appliances in the files can be upgraded from a single upgrade machine in the NOC.

15. Operations

Starting the Gateway

- Select **Control Panel** from side/top **Overview** Menu
- Confirm that warnings are clear
- Start the Media Processing First
 - Media Processing will start the Transcoding resources.
 - Note that Media Processing is optional
- Start the Media Gateway Second.
 - Media Gateway will start
 - TDM Hardware Spans (T1/E1 ports)
 - Netborder SS7 to VoIP Gateway Software
- Confirm that the **boot** button is selected.
 - This will confirm that gateway starts on reboot.

NOTE

Before attempting to pass traffic through the gateway, proceed to **TDM Status** to check the state of the NSG gateway. There is no point of attempting calls while the status of the gateway protocol is down.

Field Name	Description
Port	Physical Port number. Identifies the hardware resource and T1/E1 port number. The T1/E1 port number relates to the T1/E1 board.
Type	Signaling Type In this example we see: M2UA
Physical	Physical T1/E1 layer status. Hover the mouse over the Physical status section (green) to display detailed T1/E1 alarms and status.
Data Link	MTP2 Link Layer status. Hover the mouse over the UP and a popup will display detailed MTP2 status
Network	M2UA Link Layer status Hover the mouse over the UP and a popup will display detailed M2UA status
Remote	Remote MGC Megaco Peer status. This indicates that MG is connected to the MGC Megaco profile. Hover the mouse over the UP and a popup will display detailed Megaco Peer status
Channels	If Megaco link state is IN-SERVICE Channel is blue - down If Megaco link state is OUT-OF-SERVICE Channel is red – down If channel is in use Channel is green – up Hover the mouse over each channel for more detailed data.

Hover the mouse over Physical Status Section.
For detailed information about Alarms refer to Troubleshooting Section 18.

118

Hover the mouse over Remote Section

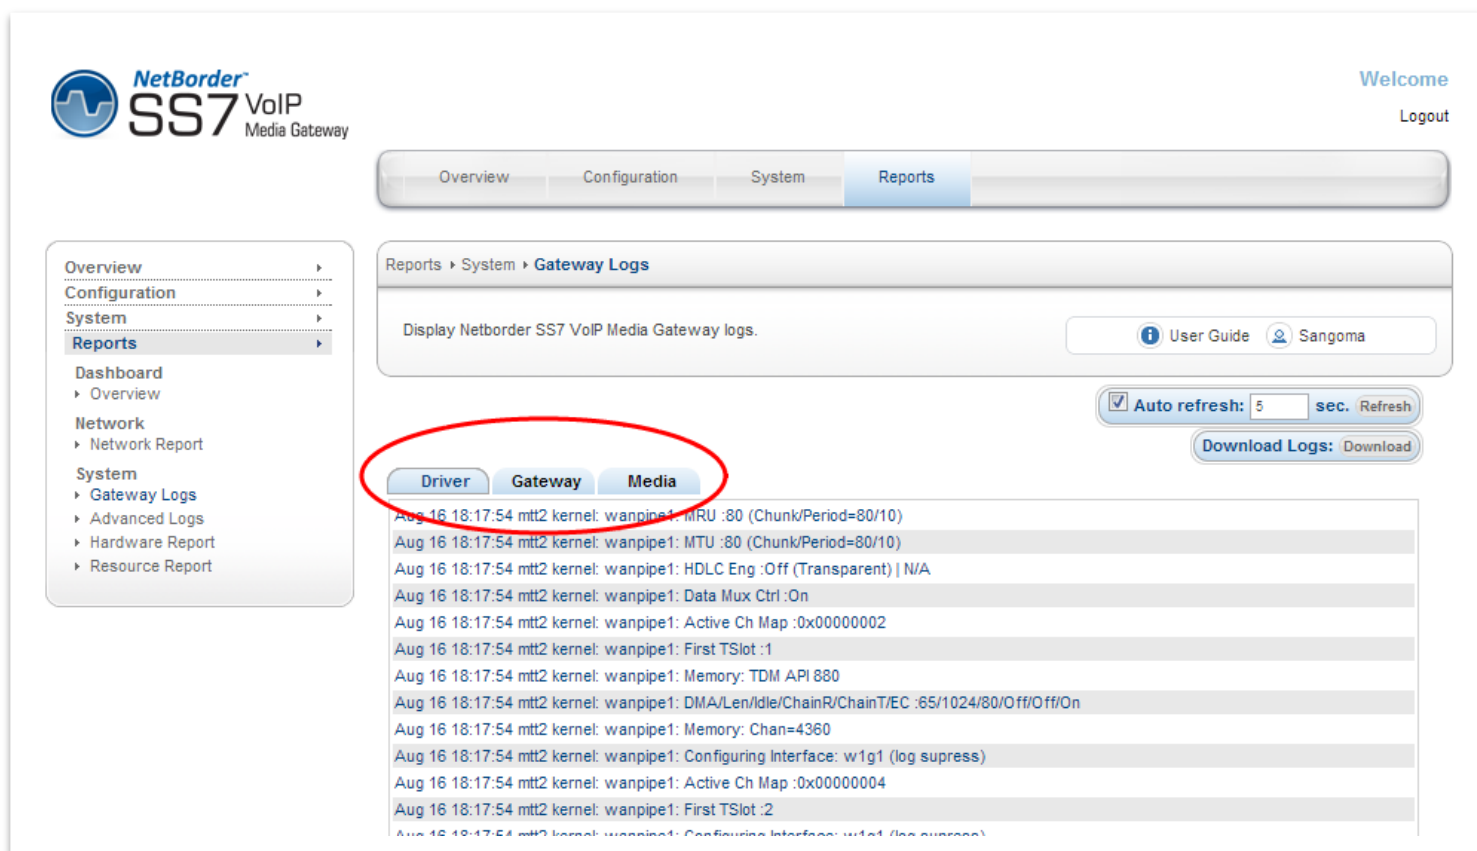

peer	PEER_STATE_ACTIVE	Remote MGC Megaco protocol is in sync with local Megaco profile.

Reports

Gateway Logs

- Select **Gateway Logs** from side/top **Reports** Menu

The screenshot displays the NetBorder SS7 VoIP Media Gateway web interface. The top navigation bar includes 'Overview', 'Configuration', 'System', and 'Reports'. The left sidebar menu shows 'Overview', 'Configuration', 'System', and 'Reports' (highlighted). Under 'Reports', there is a sub-menu with 'Dashboard', 'Overview', 'Network', 'Network Report', 'System', 'Gateway Logs' (highlighted), 'Advanced Logs', 'Hardware Report', and 'Resource Report'. The main content area shows 'Reports > System > Gateway Logs'. Below this, it says 'Display Netborder SS7 VoIP Media Gateway logs.' and includes links for 'User Guide' and 'Sangoma'. There is an 'Auto refresh' section with a checkbox, a value of '5', and a 'sec. Refresh' button. A 'Download Logs' button is also present. The logs are displayed in a table with three tabs: 'Driver', 'Gateway' (selected and circled in red), and 'Media'. The logs show various system events, including kernel messages, MTU settings, HDLC engine status, data mux control, active channel map, first TSlot, memory usage, DMA/Len/Idle/ChainR/ChainT/EC, and configuring interface.

Driver	Gateway	Media
Aug 16 18:17:54 mtt2 kernel: wanpipe1: MRU :80 (Chunk/Period=80/10)		
Aug 16 18:17:54 mtt2 kernel: wanpipe1: MTU :80 (Chunk/Period=80/10)

Aug 16 18:17:54 mtt2 kernel: wanpipe1: Configuring Interface: w1g1 (log supress)		

NOTE

All error events will be displayed in RED for easy identification.

<i>Log</i>	<i>Description</i>
Driver	<p>TDM device driver log. All errors will be identified in RED This log will show</p> <ul style="list-style-type: none"> • TDM Driver startup sequence • TDM T1/E1 connection/disconnection • TDM Driver general errors • System errors • OS Errors
Gateway	<p>SS7 to VoIP Gateway log All errors will be identified in RED This log will show</p> <ul style="list-style-type: none"> • Gateway startup sequence • Gateway startup errors • Gateway run time errors and warnings
Media	<p>Media Transcoding log All errors will be identified in RED This log will show</p> <ul style="list-style-type: none"> • Media Transcoding server startup sequence • Media startup errors • Media transcoding run time errors and warnings

Packet Capture

The packet capture page captures network traffic from Ethernet interface, TDM interface or both.

- Select **Packet Capture** from side/top **Reports** Menu
- Filter
 - Default filter will capture all packets on the Ethernet device
- Select Capture to start capturing
- Wait...
- Select Stop Capture when Capture done
- Download Link with capture pcap file is ready for download.

Ethernet Capture Filter Options

host <ip>	True if either the IPv4/v6 source or destination of the packet is host.
dst host <ip>	True if the IPv4/v6 destination field of the packet is host, which may be either an address or a name
src host <ip>	True if the IPv4/v6 source field of the packet is host.
net <ip>	True if either the IPv4/v6 source or destination address of the packet has a network number of net.
port <port>	True if either the source or destination port of the packet is port.
dst port <port>	True if the packet is ip/tcp, ip/udp, ip6/tcp or ip6/udp and has a destination port value of port.
src port <port>	True if the packet has a source port value of port.
vlan <vlan_id>	True if the packet is an IEEE 802.1Q VLAN packet. If [vlan_id] is specified, only true if the packet has the specified vlan_id. For example: vlan 100 && vlan 200 filters on VLAN 200 encapsulated within VLAN 100, and vlan && vlan 300 && ip filters IPv4 protocols encapsulated in VLAN 300 encapsulated within any higher order VLAN.
tcp, udp, icmp	True if protocol matches
not <port> not <ip>	Exclude a port/ip/protocol out of the trace

NOTE

Please refer to tcpdump documentation for more info.

16. Cable Pinouts: T1/E1

NSG Appliance utilizes Sangoma TDM T1/E1 digital board adapters.

- A101D / A101DE – 1-port E1/T1
- A102D / A102DE – 2-port E1/T1
- A104D / A104DE – 4-port E1/T1
- A108D / A108DE – 8-port E1/T1*

A108D Port Information

The A108D card has dual purpose RJ45 connector, as it provides access to two T1/E1 ports from a single RJ45 Female connector.

NOTE

There are two LED per RJ45 connector.

A108D Straight Cable	A108D Cross Over – Back-to-Back Cable
Y Cable for A108 to 2 separate T1/E1 (straight). This is to connect the A108 against lines from the Telco.	Y Cable for A108 to 2 separate T1/E1 (cross). This is to connect the A108 against another T1/E1 card.
A = port N; B = port N + 4 1 <-> 1A [Rx ring] 2 <-> 2A [Rx tip] 3 <-> 1B 4 <-> 4A [Tx ring] 5 <-> 5A [Tx tip] 6 <-> 2B 7 <-> 4B 8 <-> 5B	A = port N; B = port N + 4 1 <-> 4A 2 <-> 5A 3 <-> 4B 4 <-> 1A 5 <-> 2A 6 <-> 5B 7 <-> 1B 8 <-> 2B

17. Troubleshooting

Physical Layer

The first step in troubleshooting any connectivity issue is troubleshooting the physical layer. Identifying whether a user has a physical layer issue is by using the **TDM Status** page and checking the MTP-1/M2UA column.

If the column is listed as "DOWN" for that particular port, proceed with troubleshooting the physical layer.

TDM Status	
Port	MTP-1
A108_1_1	DOWN

When physical layer is down, all layers above the physical layer will also be in a "DOWN" or "TRYING" state.

In order to start troubleshooting, the user must proceed to the "Command Execution" page, which is located under the "Configuration" menu.

Netborder SS7 > Operation > **Command Execution**

Enter a Shell/NSV-MG Command below, then click EXECUTE in order to run taht comand. For SS7 Rleated NSV-MG Commands, see the User Guide [User Guide](#)

Execute Command

Shell command:

NSG Command:

For a list of the valid commands use: help

Execute

The best way to troubleshoot physical layer issues is through the shell command option. Below is a list of commands that can be run within the shell command section to help diagnose issues:

Linux Commands

- **ifconfig**
Displays all network interfaces
Sangoma interfaces start with "w" eg: "w1g1" for span1, "w2g1" for span2 ...
- **cat /proc/interrupts**
Displays the interrupt status for all cpu and devices
- **hdparm -t /dev/sda**
Check for disk access speed. If speeds are less than 10MBps it could indicate that motherboard/chipset is not supported by Linux kernel.
- **vmstat**
Outputs system load information
in = interrupt per timeout
cs = context switching
us = user load
sy = system load (kernel)
id = idle

Sangoma TDM Driver related commands

- [wanpipemon -i wXg1 -c Ta](#) (where X is the span number in question. Can also be found using ifconfig)
Output low level T1/E1 Alarms
- [wanrouter status](#)
Output wanpipe physical status statistics

Wanpipe Port Status

The first step in debugging physical layer issues would be to check whether wanrouter status reports the line "Connected" or "Disconnected". To do this, within the "Shell Command" textbox, enter the command "wanrouter status". It will return a result like the one below:

-> **wanrouter status**

```
Shell Command

Devices currently active:
    wanpipe1

Wanpipe Config:

Device name | Protocol Map | Adapter | IRQ | Slot/IO | If's | CLK | Baud rate |
wanpipe1   | N/A          | A101/1D/A102/2D/4/4D/8 | 169 | 4        |      | 1    | N/A      | 0

Wanrouter Status:

Device name | Protocol | Station | Status
wanpipe1    | AFT TE1 | N/A     | Disconnected
```

All the devices running on a NSG system will be listed as a "wanpipe" device. In this example, "wanpipe1" is being reported as "Disconnected", which tells us that the physical layer is in fact in a "DOWN" state.

Wanpipe Port T1/E1 Alarms

The next step would be to check where the issue lies.

To do this, the user would need to run the command

- `wanpipemon -i wXg1 -c Ta`
(where X stands for the wanpipe number).

In this example, "wanpipe1" is in a disconnected state, therefore the interface name would be "w1g1". The command returns an output similar to the one below:

-> `wanpipemon -i w1g1 -c Ta`

Shell Command

```
***** w1g1: E1 Rx Alarms (Framer) *****

ALOS:   OFF      |  LOS:  ON
RED:    ON       |  AIS:  OFF
LOF:    ON       |  RAI:  OFF

***** w1g1: E1 Rx Alarms (LIU) *****

Short Circuit:  OFF
Open Circuit:   ON
Loss of Signal: ON

***** w1g1: E1 Tx Alarms *****

AIS:   OFF      |  YEL:  ON

***** w1g1: E1 Performance Monitoring Counters *****

Line Code Violation      : 0
Far End Block Errors     : 0
CRC4 Errors              : 0
FAS Errors               : 0

Rx Level                 : < -44db
```

1. First check the Rx Level

The correct value is -2.5db

Anything other than -2.5db indicates that there is a problem with the line.

Options

-2.5db - rx level is perfect

-10db to -20db - there is something on the line but very weak. Could indicate a cable problem.

-44db - there is nothing on the line. Either line is not started or there is no clock on the line.

Sangoma cards will not come up if there is no clock on the line.

One way to confirm that Telco is not giving us the clock, is to go back to TDM Physical

Configuration section and configure the TDM Port for Master T1/E1 Clock. Note: Telco should

always supply the clock.

2. Rx Alarms

Rx Alarms indicated that there is something wrong on the line

RED - We are not receiving any kind of signal on the line.

Usually indicates that the line is not active.

AIS - The remote end is keeping us down on purpose

Line in maintenance

RAI - We receive good signal from remote end, but remote end does not see a good signal from us.

Thus remote end is down.

3. Short/Open Circuit

These statistics usually indicate cable issues.

Or that the port is not plugged in at all.

(Which in this example is the case)

For a description on what each alarm description and meaning, please see the Appendix.

MTP2 Layer

18. Appendix

Wanpipemon T1/E1 Line alarms

The following wanpipemon command can be used to view any alarms indicated on the physical T1/E1 line plugged into the port(s):

```
wanpipemon -i <interface> -c Ta
```

interface values for the command above are w1g1 (port 1), w2g1 (port 2), w3g1 (port 3)...etc. Replace '<interface>' with your interface value (ex. wanpipemon -i w1g1 -c Ta)

Below is a sample output of wanpipemon for an E1 interface w1g1

```
wanpipemon -i w1g1 -c Ta
```

```

Far End Block Errors : 4215

CRC4 Errors : 0

FAS Errors : 3

Rx Level : > -2.5db

As noticed, the alarms are split in 3 different categories:

->Rx Framing alarms

->Rx (LIU) alarms

->Performance Monitoring Counters

Below is a description of each Alarm:

RED	Indicates the device is in alarm
LOF	(Loss of Framing). Raised after four consecutive frames with FAS error. If RAI and AIS alarms are not indicated, verify that you have selected the proper line framing (i.e T1: ESF, D4, E1:CRC4, NCRC4..etc)
LOS	(Loss Of frame Signal)
AIS	(Alarm Indication Signal): typically know as a BLUE Alarm. all-ones signal transmission to the receiving equipment (the Sangoma card) to indicate that an upstream repeater (telco equipment) is in alarm, due to upstream transmission fault, either from another repeater or from the telco itself. If the only alarms indicating in the wanpipeXmon output is AIS:ON, then contact your telco with this information (RAI:ON can also be a possibility in this case as well) Example call diagram of the scenario: Sangoma card <-----repeater <-----Telco
RAI	(Remote Alarm Indication): Indicates that the Far end (typically the Telco) is in RED alarm state and sending that message over the line. If the only alarm in your wanpipeXmon output is RAI:ON then contact your telco with this information. You will also get this alarm, and only this alarm, if your framing is incorrect. This setting can be changed in the wanpipeX.conf file.

Short Circuit	the wires in your cable connected to the port are crossed. If you see this alarm, check the pinouts for the cable you are using. You may also be plugging in the wrong form of cable (straight-through, or cross-over)
Open Circuit	No line plugged into the port. Make sure that your connector is plugged in and the wiring is making a good connection. If this alarm is on, you will also Rx Level='-36'-'-44'.
Loss of Signal	Cabling issue. Check the health of the cable plugged into the port, as well as its connection to the port it is plugged into. You will also see the Rx Level either very low, or in a disconnected state: -36 -> -44. It is typical to have this alarm triggers in combination with 'Open Circuit' if there is an issue with the physical connection
YEL	When the equipment enters a Red-Alarm state, it returns a Yellow-Alarm back up the line of the received OOF. A typical scenario would be mis-configuration during the Sangoma card configuration (i.e selected CRC4 vs NCRC4). In this type of scenario also LOF and RED alarms will be triggered.
Line Code Violation	This occurs upon a bipolar violation
Far End Block Errors	is reported by the upstream end of the PHY (the wire between you and the switch) on the out-of-band management channel. This means the other end of the line received bad data from you. Possible reason are: line noise, corroded wires..etc. Also, check line Framing (E1: CRC4 vs NCRC4)
CRC4 Errors	This occurs when the CRC polynomial calculation performed before transmission does not match the CRC calculation done upon reception.
FAS Errors	(Frame alignment signal error). One or more incorrect bits in the alignment word
Rx Level	Signal strength of the connection between the Sangoma card and the other end. Health connection will show -2.5db. If you notice your connection lower (i.e. -10db-->-12db, or -36fb, -44 db) Then check the cable or possibly replace it. If the Rx level is very low, it can trigger Loss of Signal Tx, or even Open Circuit tx.

SS7 Overview

The *Common Channel Signaling System No. 7* (SS7 or C7) is a global standard that defines the procedures and protocols used to setup most of the world's public switched telephone network (PSTN) calls. The ITU definition of SS7 allows multiple national variants such as North America's American National Standards Institute (ANSI) and Europe's European Telecommunications Standards Institute (ETSI) standard.

Each time you place and release a telephone call that extends beyond the local exchange, SS7/C7 signaling takes place.

The SS7 network and protocol are used for:

- To set up and tear down telephone calls
- Number translation (LNP)
- Toll-free (800) wireline services
- Wireless services such as SMS

SS7 messages are exchanged between two endpoints called signaling points on a 64 kbps bi-directional channels (DS-0) known as signaling links. Each signaling point is uniquely identified by a numeric point code used to identify the source and destination of each message.

There are three types of signaling points in the SS7 network

:

- Service Switching Point (**SSP**)
 - Terminate signaling links
 - Start, end, and switch calls
- Service Transfer Point (**STP**)
 - Main routing switches
- Service Control Point (**SCP**)
 - Switches attached to databases

SS7 Signaling Points

Signaling links are categorized by link type ranging from A to F.

SS7 Link Types

A Link (access)	Link between an SSP or SCP to an STP. Its purpose is to deliver signaling messages
B Link (bridge)	Link between 2 mated STPs
C Link (cross)	Link between 2 STPs making them a mated pair
D Link (diagonal)	Link between 2 mated STPs (different hierarchical levels)
E Link (external)	Link between an SSP and a secondary mated STP
F Link (fully associated)	Link between 2 SSPs

SS7 Stack layers

The Message Transfer Part (MTP) consist of 3 layers

MTP1 is the physical layers protocol that can be E-1 (2048 kbps, 32 x 64kbps), DS-1 (1544kbps, 24 x 64kbps), V.35 (64kbps), DS-0 (64kbps) and DS-0A (56kbps).

MTP2 is the data link layer protocol that ensures reliable communications on a signaling link via error checking, flow control and sequence checking.

MTP3 is the network layer protocol that ensures reliable communications to other nodes in the network via addressing, routing and congestion control.

ISND User Part (ISUP) defines the protocols used to set-up, manage and release trunk circuits that carry voice and data on the PSTN.

Signaling Connection Control Part (SCCP) provides connectionless and connection-oriented network services and global title translation (GTT) capabilities above MTP level 3. SCCP is used as the transport layer for TCAP-based services.

Transaction Capabilities Applications Part (TCAP) supports the exchange of non-circuit related data between applications across the SS7 network using the SCCP connectionless service.

SIP Overview

SIP transactions and dialogs

A SIP signaling session between two User Agents (UAs) is composed of one or more SIP transactions. A SIP transaction occurs between a User Agent Client (UAC) and a User Agent Server (UAS). It might involve one or more intermediate SIP servers such as a proxy or redirect server. A SIP transaction comprises all messages that begin with the SIP request initiated from the UAC, until a final response (a non-1XX or non-provisional) is received from the UAS.

Typically, a SIP transaction comprises a SIP request message followed by one or more SIP response messages.

SIP messages

Each SIP transaction consists of a request that invokes a particular method, or function, on the server, and at least one response.

SIP requests

SIP requests are messages that are sent from client to server to invoke a SIP operation. RFC 3261 defines six requests or methods that enable a User Agent or SIP proxy to locate users and initiate, modify, and tear down sessions:

- **INVITE:** An INVITE method indicates that the recipient user or service is invited to participate in a session. This method can also be used to modify the characteristics of a previously established session.
- **ACK:** An ACK request confirms that the UAC has received the final response to an INVITE request. ACK is used only with INVITE requests.
- **OPTIONS:** An OPTIONS request is used to query servers about their capabilities. If the UAS is capable of delivering a session to a user, it responds with its capability set.
- **BYE:** A BYE request signifies the termination of a previously established session.
- **CANCEL:** A CANCEL request allows UACs and network servers to cancel an in-progress request, such as an INVITE.
- **REGISTER:** A REGISTER request is used to register the current contact information.

In addition, RFC 3515 defines the REFER method. This SIP extension requests that the recipient REFER to a resource provided in the request. This method can be used to enable many applications,

including call transfer.

SIP responses

A server sends a SIP response to a client to indicate the status of a SIP request that the client previously sent to the server. Specifically, the UAS or proxy server generates SIP responses in response to a SIP request that the UAC initiates.

SIP responses are numbered from 100 to 600. For a complete list, see Section 21 of RFC 3261.

SIP message structure

A SIP message consists of the following four main components:

- start-line
- one or more header fields
- empty line indicating the end of header fields
- optional message body.

Start-line

The start-line for a SIP request is known as the Request-Line. The start-line for a SIP response is known as the Status-Line.

The Request-Line specifies the SIP method, the Request-URI, and the SIP version.

The Status-Line describes the SIP version, the SIP response code, and an optional reason phrase.

The reason phrase is a textual description of the 3-digit SIP response code.

SIP headers

A SIP message is composed of header fields that convey the signaling and routing information for the SIP network entities (User Agent, proxy, B2BUA, and so on). Each header field consists of a field name followed by a colon (:) and the field value. For a description of the key SIP headers, refer to Section 7.3 of RFC 3261.

SDP body

The SDP (Session Description Protocol) body contains information about the message. The SDP body is optional. For a complete explanation of the SDP session description, see RFC 2327.

Redundant DC PSU

Sangoma NSG appliances come with redundant DC power supply.

VOLTAGE	DC -36V ~ -72V
INPUT CURRENT:	12.0A (RMS). FOR -48 VDC
INRUSH CURRENT	20A (Max)
DC OUTPUT	400W (Max)

MODEL 型号: DMRW-6400F (ROHS)
DC INPUT 直流输入: -42V ~ -72V 12A
FUSE RATING 保险丝规格: 20A/250V
DC OUTPUT 直流输出: 400W (MAX)
+5V 32A +12V 25A +3.3V 0-25A
-5V 0-0.5A -12V 0-1.2A +5VSB 0-2A
+5V AND +3.3V TOTAL MAX: 45A
+5V, +3.3V AND +12V TOTAL MAX: 375W

- **TEMPERATURE RANGE : OPERATING 100C --- 400C**
- **HUMIDITY: OPERATING: 20%-95%, NON-OPERATING: 10%-95%**
- **REMARKS: 85% IS NORMAL CONDITION AND 95% IS WITH SPECIAL COATING PROCESS**
- **HOLD UP TIME: 1.6 ms MINIMUM AT FULL LOAD & NOMINAL INPUT VOLTAGE**
- **DIELECTRIC WITHSTAND: INPUT / OUTPUT 1500 VAC FOR 1 SECOND**
- **INPUT TO FRAME GROUND 1500 VAC FOR 1 SECOND**
- **EFFICIENCY: 65% TYPICAL, AT FULL LOAD**
- **POWER GOOD SIGNAL: ON DELAY 100 ms TO 500 ms, OFF DELAY 1 ms**
- **OVER LOAD PROTECTION: 130 ± 20%.**
- **OVER VOLTAGE PROTECTION: +5V → 5.5V ~ 7.0V, + 3.3V → 4.0V ~ 4.5V**
- **SHORT CIRCUIT: +5V, +12V, +3.3V**
- **EMI NOISE FILTER: FCC CLASS A, CISPR22 CLASS A**
- **SAFETY: UL 1950, CSA 22.2 NO/ 950, TÜV IEC 950**
- **REMOTE ON / OFF CONTROL**
- **THE UNIT SHALL ACCEPT A LOGIC OPEN COLLECTOR LEVEL WHICH WILL DISABLE / ENABLE ALL THE OUTPUT VOLTAGE (EXCLUDE +5V STANDBY), AS**

LOGIC LEVEL IS LOW, OUTPUTS VOLTAGE WERE ENABLE, AS LOGIC LEVEL IS HIGH, OUTPUTS VOLTAGE WERE DISABLED

- COOLING : TWO 40 mm DC FANS (MODULE)
AC INLET IN EACH MODULE

DC PSU Cables

Connecting cables to a power supply depends on the remote power source.

<i>Power Source Type</i>	<i>Black Wire</i>	<i>Red Wire</i>
If power source -48V	-48V	0V (Ground)
If power source +48V	0V (Ground)	+48V

- The PSU **has** voltage reverse protection.
If the red and black wires are connected the wrong way, the system will not power up. But there will be **no** damage to the PSU or the system.

Hot-swap procedures

Please refer to the following when either power module is defective.

- Locate the defective power module by examining the individual LED (if LED is distinguished, it indicates the power module is defective).

***** WARNING**

please perform the following step carefully; otherwise, it may cause the whole system shutdown.

***** WARNING**

Please do not remove the defective power module until you have worn gloves to keep from been burned. This is due to the cover of the power module is used as heat sink for cooling. Usually, its temperature is around 50-60 degree Celsius under full load condition.

- Loose the screws of power module bracket.
- Plug out the defective power module.

***** WARNING**

please put aside the power module to wait for cooling down. Keep other people from toughing it until it is cooled.

- Replace a new / GOOD power module. Insert the power module into the power system till to the end.
- Check the LED of the power module, which should be in GREEN.
- Check the warning LED indicating the status of total power system, which should be in GREEN.
- Tighten the screws of the power module.
- If you want to test this new power module and simulate the defective situation, please refer to Section 1.7 Installation & Testing.

Remarks: If the DC fan of the power module fails, you have to replace the power module. Please follow the Hot-Swap Procedures for replacement.

Trouble Shooting

If you have followed these instructions correctly, it should function normally.

Some common symptoms are, the system doesn't work, buzzer alarms, shutdown after running a very short period,... etc. If so, please check the following steps to verify and correct it.

- Check all connection (if pinouts is correct, if any connection loosed, if the direction is incorrect,... etc.).
- Check if any short-circuit or defective peripherals by plugging out the power connector from each peripheral, one at a time. Shall the system functions again, you have solved the problem.
- Once you hear the buzzer sound or see the warning LED in RED, please check,
- If the loading is under the minimum or over the maximum load of each channel.
- If the power source is well connected and supplied. Shall the above condition is happened, please disconnect the power source and wait for 2-3 minutes to release the protection status; then test it again.
- If buzzer keeps alarming or LED indicates the power module failure, please locate which power module is defective. Perform hot-swap procedures (ref. to Sec. 1.8 Hot-Swap Procedures). Return the defective power module back to your vendor for RMA procedure.
- If you cannot fix the problem, please contact your vendor for supporting.
