

Initial configuration

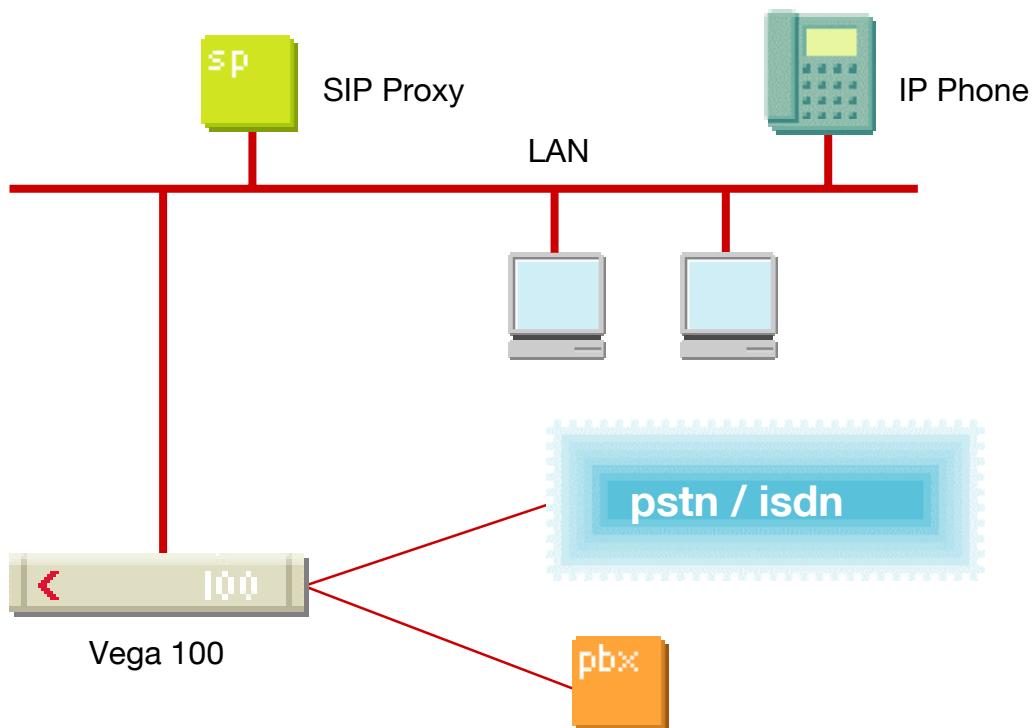

Vega 100 T1 (SIP) – R6

This document describes how to configure the Vega 100 T1 SIP unit using the web browser interface. The configuration described will allow the Vega to be rapidly installed and tested.

The instructions below will configure the Vega 100 to be a transparent gateway for a SIP Proxy.

- Calls made from the PBX or PSTN to the Vega will be forwarded to the SIP Proxy. The dialled number passed to the Vega will be forwarded unchanged to the SIP Proxy.
- Calls made from the SIP Proxy to the Vega will be forwarded to the PSTN or to the PBX based on the leading two digits of the telephone number passed by the proxy. A leading 01 will cause the call to be routed to the PSTN, and a leading 02 will cause the call to be routed to the PBX. The digits following the 01 or 02 will be passed as the dialled digits.

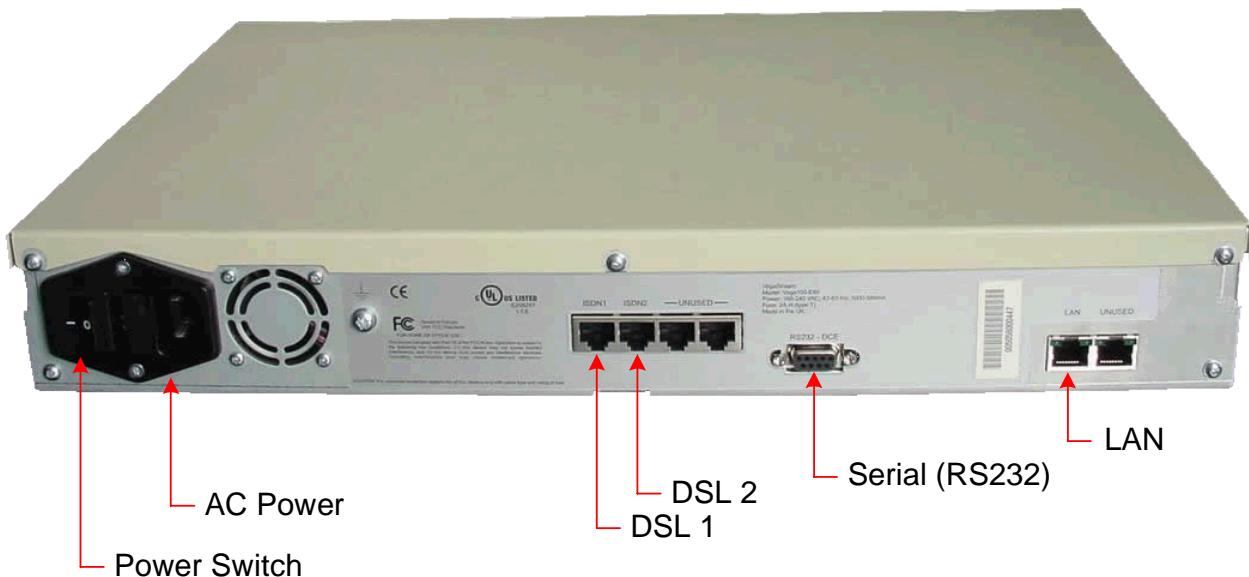

The configuration process is broken down into 12 stages as follows:

- 1 Connect your Vega to LAN, Telephone and Power
- 2 Configure the basic LAN parameters
- 3 Configure password and login timeout
- 4 Check and configure LAN settings and Host name
- 5 Configure the Dial Plan
- 6 Configure SIP and audio parameters
- 7 Configure Authentication
- 8 Configure Registration
- 9 Configure DSLs
- 10 Configure pointer to CD ROM documentation
- 11 Save Changes
- 12 Archive Vega Configuration

Please also see:

- 13 Technical Support
- 14 Advanced configuration

1. Connect your Vega to LAN, Telephone and Power

Before installing your Vega, ensure that you read the VegaStream VoIP Gateways Safety and Compliance Information document.

LAN:

Using the yellow booted cable connect the LAN port on the Vega to a standard or fast Ethernet hub or switch (10 baseT or 100 baseTx). The connector nearest the ferrite core should be plugged into the Vega.

Telephony:

Connection to a PBX - If you are connecting the Vega 100 to a PBX, the Vega 100 acts as the NeTwork equipment and a red-booted cable must be used.

For each trunk that is to be connected to the PBX, insert one end of a red booted cable into one of the Vega 100 DSL sockets [DSL 1 or DSL 2] and the other end to the PBX.

Connection to the PSTN - If you are connecting the Vega 100 directly to the public telephone network it acts as the Terminal Equipment and the blue-booted cable must be used.

For each trunk that is to be connected to the PSTN, insert one end of a blue booted cable to one of the Vega 100 DSL sockets [DSL1 or DSL2] and the other end to the PSTN terminating box.

Power:

Insert the power cable into the AC power inlet on the Vega and switch on. The power LED on the front panel will illuminate.

The LAN LEDs will also illuminate indicating 10 (baseT) or 100 (baseTx) connection, and the FDX LED will illuminate if Full Duplex mode has been negotiated.

2. Configure the basic LAN parameters

If a DHCP server is available, by default, the Vega will automatically pick up an IP address. If you know the IP address served to the Vega, skip this section and start at section [3](#).

If DHCP is not to be used to provide the Vega with an IP address, or you need to check the IP address provided to the Vega, connect the serial interface of the Vega to a PC serial interface using a 9 way male to female straight through cable.

Configure a terminal emulator program (such as Microsoft's HyperTerminal) for:

- Speed = 115200 baud
- Data bits = 8
- Parity = none
- Stop bits = 1
- Flow Control = none

Press <Enter> to get the Username: prompt

At the prompts enter the default user name and password

Username: admin

Password: admin

To display the current IP address, type:

➤ show lan.ip

If this is not the IP address required, it can be overridden, together with other LAN parameters by typing:

➤ set lan.use_dhcp=0
➤ set lan.ip=aaa.bbb.ccc.ddd
➤ set lan.subnet=eee.fff.ggg.hhh
➤ set lan.gateway=iii.jjj.kkk.lll
➤ save
➤ reboot system

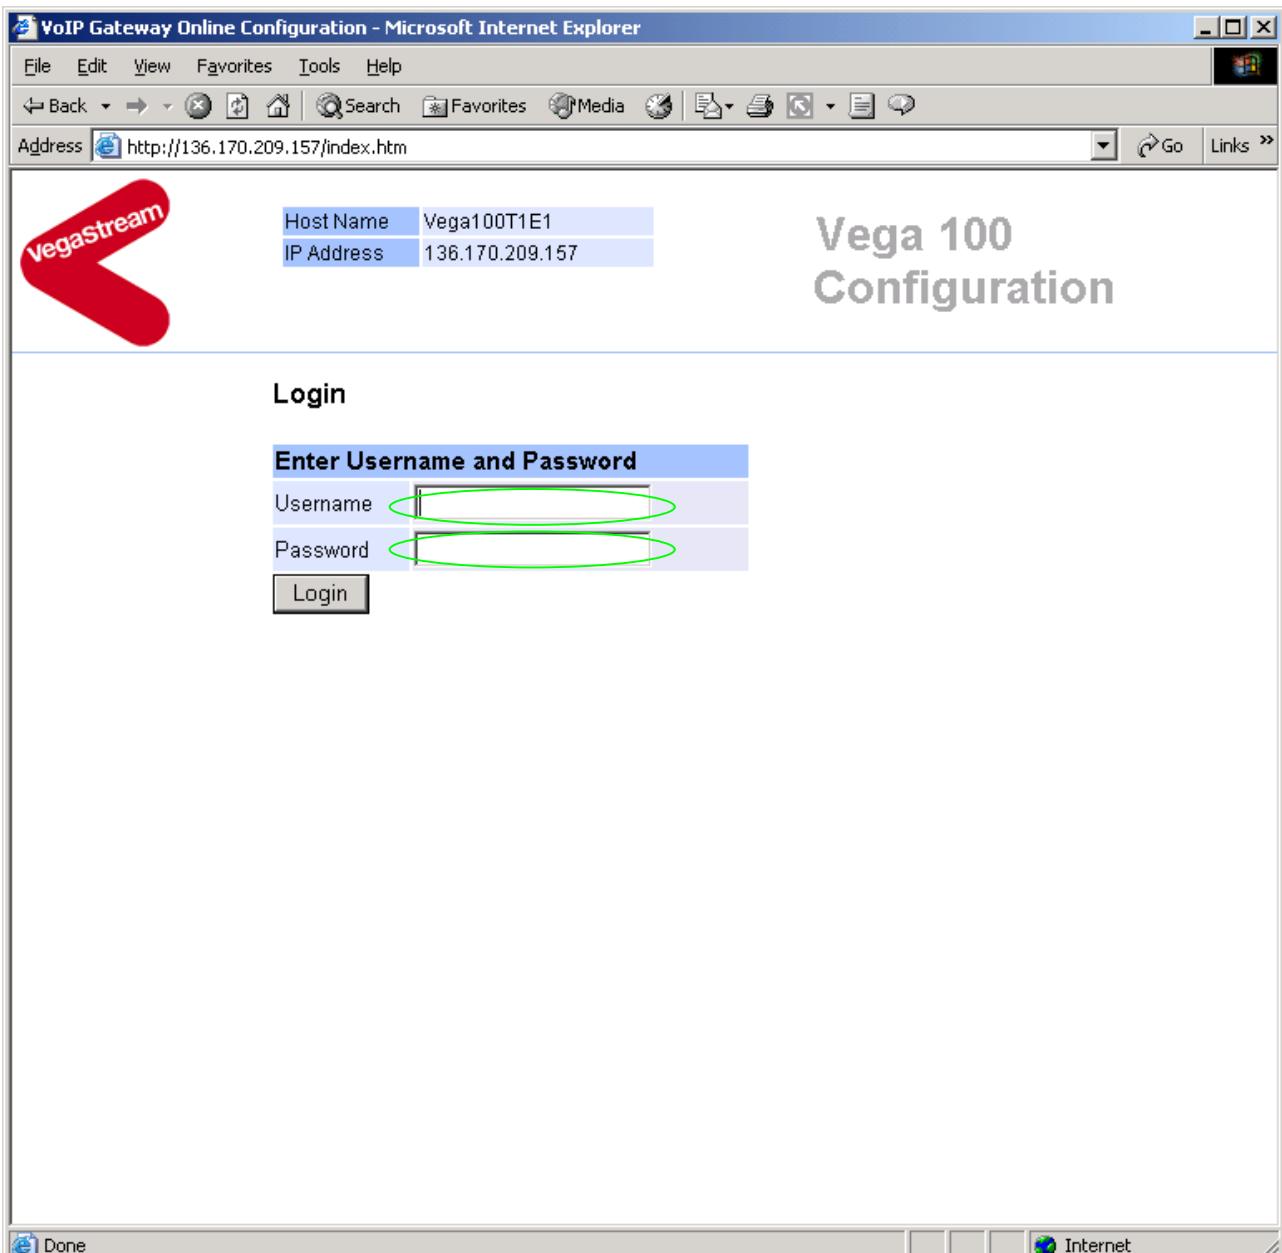

3. Configure password and login timeout

Now configuration will be carried out using a web browser.

- Enter the IP address of the Vega into the “Address” field of your web browser.

You will then be presented with the login page:

Enter the default Username and Password

➤ Username: admin

➤ Password: admin

➤ Select

The screenshot shows the Vega 100 T1E1 Online Configuration interface. At the top left is the VegaStream logo. On the right, the title "Vega 100 Configuration" is displayed. A sidebar on the left contains a menu with several options: Management, Logging, Maintenance, LAN, DSL, Dial Plan, DSP, Media, Tones, SIP, **Users**, QoS, and Advanced. The "Users" option is highlighted with a green oval. The main content area has a blue header "System Management". Below it is a "Quick Configuration Wizard" section with a "Start Wizard" button. The "System Time" section includes fields for Set Time (hh:mm:ss) [09 : 36 : 34], Set Date (dd/mm/yyyy) [06 / 11 / 2003], and Synchronise Time and Date with radio buttons for "With PC" (selected) and "With NTP server". There are "Set Time", "Set Date", and "Sync Time" buttons. Further down are sections for "Call Reports" (Show Calls, Show Trace), "System Logs" (Show Event Log, Show Billing Log), and "Call Control" (a dropdown menu set to "Unblocked" with a "Submit" button). At the bottom left are buttons for Save, Log off, Help, and Reboot System. The bottom right shows an "Internet" connection status.

➤ On the left hand side menu select Users

Vega 100 T1E1 Online Configuration - Microsoft Internet Explorer

Prompt	%u%p>
Remote Access	1
Timeout	0

Done Internet

Recommended: Change the password

- enter New Password and Re-enter Password then
 - select **Submit** and then click “[here](#)” to return

Optional: Change the timeout¹ – default is 240 seconds; can extend to 7200 seconds (2hrs)

- select **Submit** and then click “**here**” to return

¹ If the web interface is not used for this length of time the Vega will automatically log off the session. This change is only activated by logging out and back into the browser session.

4. Check and configure LAN settings and Host name

➤ On the left hand side menu select [LAN](#)

The screenshot shows the 'Vega 100 T1E1 Online Configuration - Microsoft Internet Explorer' window. The address bar shows the URL: http://136.170.209.157/vsframe?sid=1261603407&frame_id=1. The main content area displays the 'Vega 100 Configuration' screen. On the left, there is a navigation menu with links: Management, Logging, Maintenance, **LAN**, DSL, Dial Plan, DSP, Media, Tones, SIP, Users, QoS, Advanced. Below the menu are buttons for Save, Log off, Help, and Reboot System. The right side shows the configuration details. At the top, it shows Host Name: Vega100T1E1, IP Address: 136.170.209.157, and User Name: admin. A warning message 'Unsaved Configuration Changes' is displayed. The 'Local Area Network (changed)' section contains a warning: 'Warning: Changing these parameters may prevent remote access.' It shows the 'Current Mode: Standard Ethernet Mode' (selected) and 'VLAN Mode'. The 'LAN Configuration' section includes fields for Host Name (Vega100T1E1), IP Address (DHCP defined), Subnet Mask (DHCP defined), Domain Name Server (DHCP defined), Default Gateway (DHCP defined), TFTP Server (DHCP defined), Network Time Server (DHCP defined), FTP Server (136.170.209.214), NTP Offset (hhmm) (0000), and NTP Poll Interval (0). The 'Physical Layer Configuration' section has a 'Full Duplex' checkbox, which is checked and highlighted with a green oval and arrow. At the bottom, there are 'Submit' and 'Cancel' buttons.

Recommended: In the **Physical Layer Configuration** section statically select the Ethernet Type as either 100baseTx or 10 baseT (not 10baseT & 100baseTx) – whichever is appropriate

➤ select [Submit](#) and then click “[here](#)” to return

Optional: If there are any LAN values that need to be set up manually, set them up now (e.g. tftp and ftp addresses), then

➤ Select [Submit](#) and then click “[here](#)” to return

5. Configure the Dial Plan

➤ On the left hand side menu select [Dial Plan](#)

The screenshot shows the Vega 100 T1E1 Online Configuration interface in Microsoft Internet Explorer. The title bar reads "Vega 100 T1E1 Online Configuration - Microsoft Internet Explorer". The left sidebar contains navigation links: Management, Logging, Maintenance, LAN, DSL, **Dial Plan**, DSP, Media, Tones, SIP, Users, QoS, and Advanced. The main content area is titled "Dial Planner". It includes sections for "Profiles", "Planner Groups", "Planner Whitelist Enable", and "Planner Whitelists". In the "Profiles" section, there is a table with columns: Del?, Profile ID, Enabled, Name, Plans, and Chg?. A row for "Vega100T1E1_default" has a "Modify" link circled in green. In the "Planner Groups" section, there is a table with columns: Del?, ID, Name, Cause, Lan, Gatekeeper, Active times, Priority, and Chg?. A row for "Default" has a "Modify" link. In the "Planner Whitelists" section, there is a table with columns: Del?, ID, Name, Number, and Chg?. A row for "default" has a "Modify" link. Buttons for "Save", "Log off", "Help", and "Reboot System" are located on the left. A "Submit" button is in the "Planner Whitelist Enable" section. A "vegastream" logo is in the top-left corner.

Firstly, turn off the default profile:

In the **Profiles** section, Profile ID 1

➤ Select [Modify](#)

[Dial Planner](#) > Profile 1

Modify Profile

Profile ID	1
Enabled	<input checked="" type="checkbox"/>
Name	Vega100T1E1_default
Submit	

- disable (un-tick) Enabled, then
- select **Submit** and then click “[here](#)” to return

Now create a new profile and in it create a dial plan entry to handle calls being sent from ISDN to the LAN:

Dial Planner

Profiles

Del?	Profile ID	Enabled	Name	Plans	Chg?
<input type="checkbox"/>	1	0	Vega100T1E1_default	====>	Modify
Delete Add					

In the **Profiles** section

- Select **Add**

Dial Planner

Profiles

Internet

Now create a new profile and in it create a dial plan entry to handle calls being received inbound from the LAN:

In a similar manner to adding profile 2 add another profile, profile 3,

➤ set Name = LAN_to_ISDN_or_PBX

Modify the first plan for Profile 3:

➤ set Name = From_LAN

➤ set Source = IF:99,TEL:<..><.*> *(For calls from IF:99 (LAN), take the first two digits presented and store them in store <1>; take any further digits and store them in store <2>)*

➤ set Destination = IF:<1>,TEL:<2>

(The first two digits presented define the interface – 01 or 02 – and the remainder of the digits are passed on as the telephone number)

- select  and then click “[here](#)” to return

Note: *The SIP Proxy must choose the appropriate interface on the Vega to dial out from; when the Proxy presents a call to the Vega, the INVITE message starts something like:*

```
INVITE sip:021344784900@172.20.11.2 SIP/2.0
```

The digits preceding the @ (the telephone number field) must contain either 01ttt...t or 02ttt...t, where ttt...t is the telephone number to dial and 01 or 02 is the interface through which the call is to be made.

For more details on the operation of the dial planner, including the various tokens that may be used, see the section “The Dial Planner” in the Vega Primer.

6. Configure SIP and audio parameters

- On the left hand side menu select [SIP](#)

The screenshot shows the 'Vega 100 Configuration' interface in Microsoft Internet Explorer. The title bar reads 'Vega 100 T1E1 Online Configuration - Microsoft Internet Explorer'. The address bar shows the URL 'http://136.170.209.157/vsframe?sid=1261603407&frame_id=52'. On the left, a sidebar lists management options: Management, Logging, Maintenance, LAN, DSL, Dial Plan, DSP, Media, Tones, SIP (which is selected), Users, QoS, and Advanced. The main content area is titled 'SIP Configuration'. It contains two sections: 'General' and 'Multiple Proxy Support'. The 'General' section includes fields for Default Proxy Host Name/IP (set to 0.0.0.0), Local Domain (set to vegastream.com), Local SIP Port (set to 5060), Remote SIP Port (set to 5060), Accept Non-Proxy Invites (unchecked), and a QoS profile field (set to 0). A 'Submit' button is at the bottom. The 'Multiple Proxy Support' section has a mode set to 'normal' and includes fields for Minimum Valid Response (180) and Timeout (ms) (5000). It also contains a table for Backup Proxy settings:

Backup Proxy	Enabled	IP/Name	Port	Chg?
1	1	0.0.0.0	5060	Modify
2	1	0.0.0.0	5060	Modify

Buttons for Save, Log off, Help, Reboot System, Apply Changes, and Submit are located on the left and bottom of the 'Multiple Proxy Support' section. At the bottom of the configuration window, there are 'Done' and 'Internet' buttons.

In the **General** section:

- set Default Proxy Host Name/IP = `IP_address_of_SIP_proxy, or DNS_hostname_of_the_SIP_Proxy`
- set Local Domain = `Public_name_of_proxy_used_by_other_devices_to_send_their_INVITES_to`
(this value is the “outside world’s” name or IP address for the proxy)

Optional: To allow devices other than the proxy to make calls directly through the Vega

- tick Accept Non-Proxy Invites

If only the proxy is allowed to route the calls to the Vega ensure that this tick box is clear.

➤ select and then click “[here](#)” to return

➤ Scroll down to the **Audio** section

In the **Audio** section

➤ Select the audio codecs desired using the drop down menus

Unless there is a specific reason not to allow a specific codec to be used, it is recommended that all codecs should be enabled as follows:

Audio	
Audio Profile 1	G723
Audio Profile 2	G729
Audio Profile 3	G711 Ulaw
Audio Profile 4	G711 Alaw

➤ select and then click “[here](#)” to return

7. Configure Authentication

In some systems – to ensure that only authorised devices are allowed to set up and clear calls – SIP authentication is used. If authentication is used, it is typically required on the SIP REGISTRATION, INVITE, ACK and BYE messages.

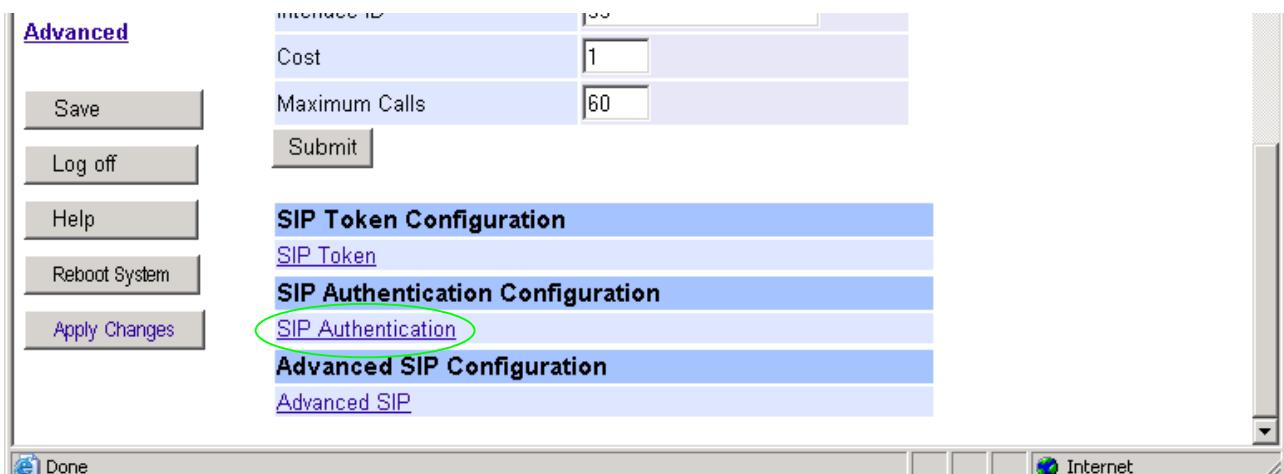

For authentication, a user-name, and a password can be configured. The user-name is constructed from three parts

Username Prefix, Username and Username Suffix

For example, to set up authentication for all calls, with

- a username of: VegaGateway123 and
- a password of: LetMeIn

- On the left hand side menu select [SIP](#)
- Scroll down to the bottom to the **SIP Authentication Configuration** section

- Select [SIP Authentication](#)

8. Configure Registration

Typically trunking gateways (like the Vega 100) do not need to register with a SIP proxy. SIP registration was designed for end users to register themselves with the SIP proxy. Trunking gateways potentially support millions of end users and so typically the presence and capabilities of the gateways are manually configured into the SIP proxy.

For telephony to SIP calls, the SIP proxy is usually manually configured to accept calls from the Vega 100

- the dialled number of the call is placed in the request URI by the Vega

For SIP to telephony calls the Proxy must send the call to the Vega 100 with a request URI of the format `iittt...t@contact_address`

- where `ii` is the interface number through which to make the call (Vega interface 01 or 02), and
- where `ttt...t` is the telephone number for the Vega to dial

In some circumstances the SIP proxy does demand that the Vega registers with it. If registration is required, see [14.1 “Configure Vega 100 registration”](#)

9. Configure DSLs

➤ On the left hand side menu select [DSL](#)

The screenshot shows the Vega 100 T1E1 Online Configuration interface in Microsoft Internet Explorer. The title bar reads "Vega 100 T1E1 Online Configuration - Microsoft Internet Explorer". The address bar shows the URL "http://136.170.209.157/vsframe?sid=1261603407&frame_id=7". The main content area is titled "Vega 100 Configuration". On the left, there is a navigation menu with links like Management, Logging, Maintenance, LAN, DSL, Dial Plan, DSP, Media, Tones, SIP, Users, QoS, and Advanced. The "DSL" link is highlighted. The main panel has two sections: "DSL Configuration" and "PORT Configuration". In the "DSL Configuration" section, the "Network Type" is set to "ETSI" and the "Network Topology" dropdown is set to "E1" (which is circled in red). Other fields include "Line Encoding" (HDB3), "Framing" (CRC4), and "Bus Master" (1). A "Submit" button is at the bottom. In the "PORT Configuration" section, there are two entries in a table:

PORT ID	Enabled	NT	Clock Master	Layer 1	E1 rx Short Haul	T1 tx equalization	ISDN	CAS	Groups	Chg?
1	1	0	0	g711Alaw64k	1	sh220_330	====>	====>	====>	Modify
2	1	1	1	g711Alaw64k	1	sh220_330	====>	====>	====>	Modify

Buttons for "Delete" and "Add" are at the bottom of the table. Below the tables, there are buttons for "Save", "Log off", "Help", "Reboot System", and "Apply Changes". The status bar at the bottom right says "Internet".

Start by selecting the correct Network Topology

DSL

This is a screenshot of the "DSL Configuration" form. It includes fields for "Network Type" (set to "ETSI"), "Network Topology" (set to "E1" which is circled in green), "Line Encoding" (set to "T1" which is also circled in green), "Framing" (set to "CRC4"), and "Bus Master" (set to 1). A "Submit" button is at the bottom.

➤ In the **DSL Configuration** section select the required Network Topology = T1

*In the **DSL Configuration** section select the Network Type as required:*

DSL

DSL Configuration

Network Type	ETSI
Network Topology	ETSI
Line Encoding	ATT
Framing	DMS
Bus Master	DMS_M1
	NI
	QSIG
	RBS
	AUTO

Submit

- ATT = 4ESS / 5ESS
- DMS = DMS 100
- DMS_M1 = Meridian specific DMS signalling
- NI = National ISDN NI1 / NI2
- QSIG = QSIG signalling
- RBS = Robbed bit CAS signaling
- AUTO – this selects DMS signaling

Note: ETSI is not supported on the T1 interface.

*In the **DSL Configuration** section select the Line Encoding as required:*

DSL

DSL Configuration

Network Type	ATT
Network Topology	T1
Line Encoding	HDB3
Framing	B8ZS
Bus Master	AMI
	HDB3
	AUTO

Submit

- B8ZS = Bipolar with 8 zero substitution (forces line reversals regularly)
- AMI = Alternate Mark Inversion
- AUTO – selects B8ZS

Note: HDB3 is not supported on the T1 interface.

In the **DSL Configuration** section select the Framing Method as required:

DSL

DSL Configuration

Network Type	ATT
Network Topology	T1
Line Encoding	B8ZS
Framing	CRC4
Bus Master	<input type="button" value="ESF"/> <input type="button" value="SF"/> <input type="button" value="CRC4"/> <input type="button" value="PCM30"/> <input type="button" value="AUTO"/>
<input type="button" value="Submit"/>	

- ESF = Extended Super-Frame – 16 state signalling
- SF = Super-Frame (also known as D4)
- AUTO – selects ESF

Note: CRC4 and PCM30 are not supported on the T1 interface

➤ select and then click “[here](#)” to return

PORT Configuration

PORT ID	Enabled	NT	Clock Master	Layer 1	E1 rx Short Haul	T1 tx equalization	ISDN	CAS	Groups	Chg?
1	1	0	0	g711Alaw64k	1	sh220_330	====>	====>	====>	Modify
2	1	1	1	g711Alaw64k	1	sh220_330	====>	====>	====>	Modify

Buttons: Save, Log off, Help, Reboot System, Apply Changes.

For the configuration indicated in the initial diagram DSL1 = connection to the PSTN and DSL 2 is a connection to a PBX. Therefore the Vega needs DSL 1 configured as TE (and a blue booted cable used on DSL 1), and DSL 2 configured as NT (and a red booted cable used on DSL 2).

Bus Master needs to be configured to point to a TE trunk – to identify where the Vega will synchronise its internal clock from – in this configuration this should be 1 (DSL 1).

These are the default settings of the Vega and so no changes are required to the Network Terminator, Clock_Master, or Bus_Master settings.

In the **Port Configuration** section, for PORT ID 1:

➤ Select [Modify](#)

The screenshot shows the Vega 100 T1E1 Online Configuration interface in Microsoft Internet Explorer. The main title is "Vega 100 Configuration". On the left, there's a navigation menu with links like Management, Logging, Maintenance, LAN, DSL, Dial Plan, DSP, Media, Tones, SIP, Users, QoS, and Advanced. A "vegastream" logo is in the top-left corner.

Port 1

Port Configuration

Port ID	1
Enabled	<input checked="" type="checkbox"/>
Network Terminator	<input type="checkbox"/>
Clock Master	<input type="checkbox"/>
Layer 1	g711Alaw64k
Set E1 RX short haul	g711Alaw64k g711Ulaw64k
T1 TX equalization	auto

ISDN Configuration

DTMF Termination Char	*
DTMF Dial Timeout	12
Setup Mapping	0
Cause Mapping	0

CAS Configuration

Dial Format String	.
Dinit Dial Timeout	6

Buttons on the left: Save, Log off, Help, Reboot System, Apply Changes. Bottom buttons: Done, Internet.

➤ Set Layer 1 = g711Ulaw64k

Note: 1. If a configuration is to be used that requires the Network Terminator value to be changed, this can be altered as well. Typically if NT is ticked then Clock Master should also be ticked. If NT is un-ticked (TE mode) then typically Clock Master should also be un-ticked.
2. if either trunk is TE then the Bus Master value (in the ISDN Configuration section) should be set to point to the (one of the) TE trunk(s); 1 for DSL 1 and 2 for DSL 2.

➤ select [Submit](#) and then click "[here](#)" to return

Return to this page:

➤ Set DTMF Dial Timeout = 5

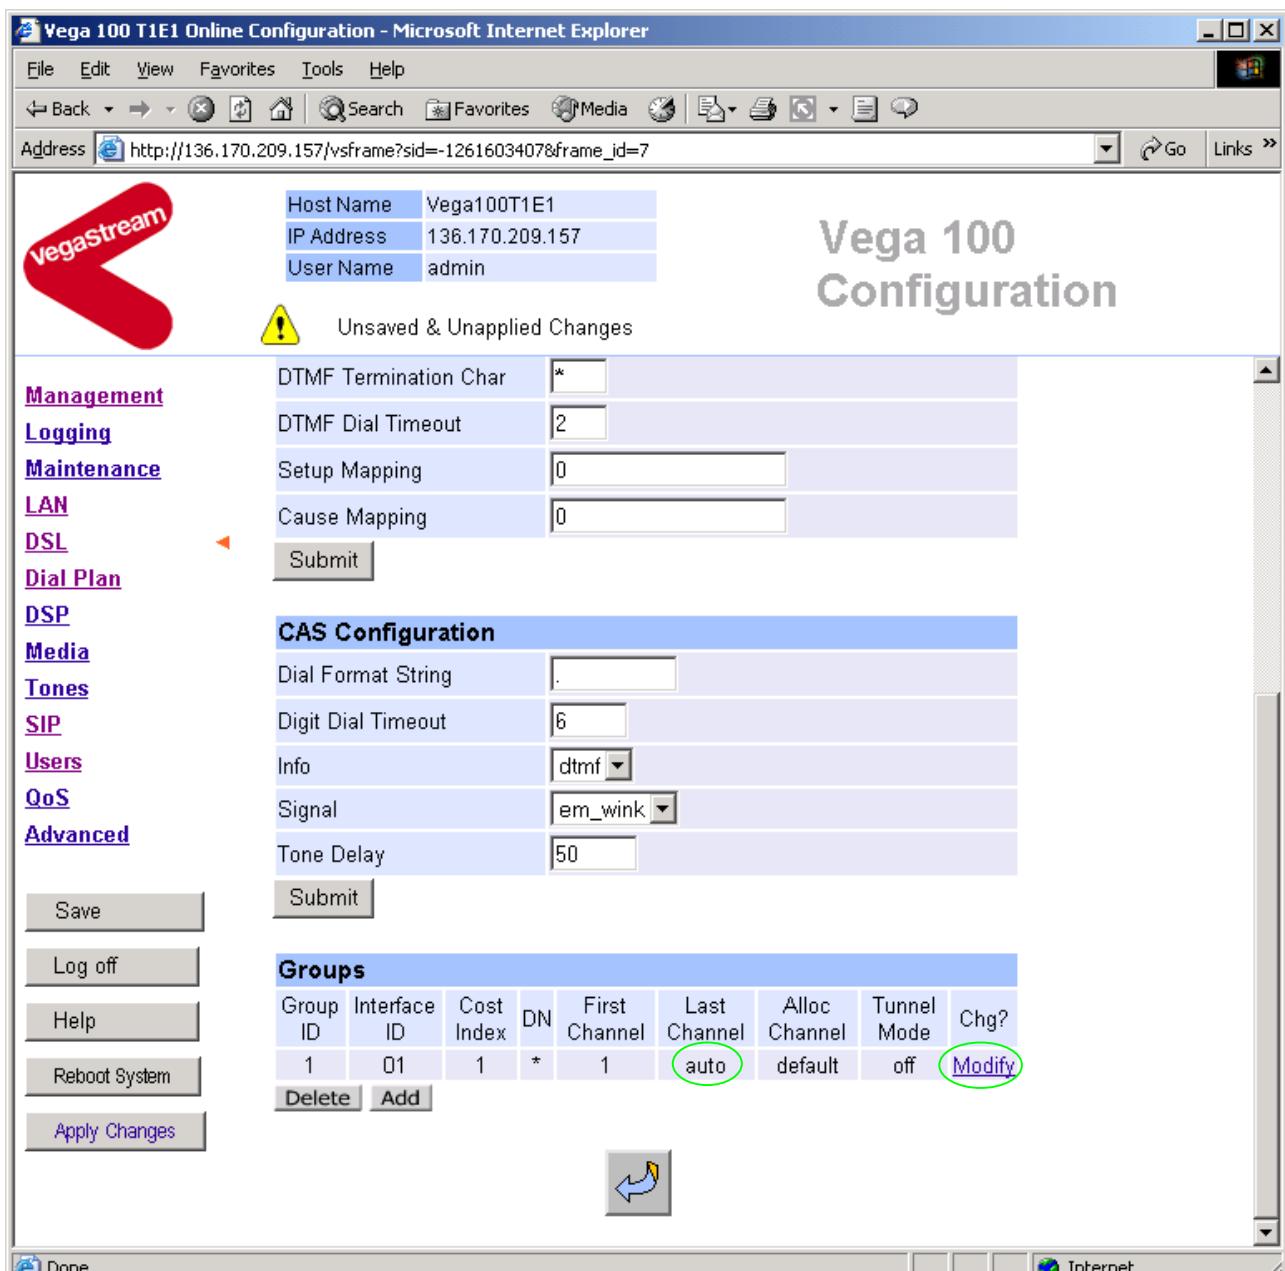

- select **Submit** and then click “[here](#)” to return

If you selected RBS as the signalling type, see RBS CAS configuration in the advanced configuration section [14.2 Configuring RBS CAS](#) for details on additional configuration.

- On the left hand side menu select [DSL](#)

In the **Port Configuration** section, for PORT ID 1:

- Again select [Modify](#)
 ➤ Scroll down to the bottom of the page

The screenshot shows the Vega 100 T1E1 Online Configuration interface. The left sidebar lists various configuration sections: Management, Logging, Maintenance, LAN, **DSL**, Dial Plan, DSP, Media, Tones, SIP, Users, QoS, and Advanced. The main area displays configuration parameters for the DSL section. A warning message "Unsaved & Unapplied Changes" is visible. Below it, the CAS Configuration section includes fields for Dial Format String, Digit Dial Timeout, Info (set to dtmf), Signal (set to em_wink), and Tone Delay (set to 50). At the bottom of the main area, there is a Groups section with a table:

Group ID	Interface ID	Cost Index	DN	First Channel	Last Channel	Alloc Channel	Tunnel Mode	Chg?
1	01	1	*	1	auto	default	off	Modify

Buttons for Delete, Add, Save, Log off, Help, Reboot System, and Apply Changes are also present. A "Done" button is at the bottom left, and an "Internet" icon is at the bottom right.

In the **Groups** section, if Last Channel is not auto

- Select **Modify** and
- Set Last Channel = auto, or 23 for PRI signalling schemes, or 24 for RBS CAS, or auto
- select **Submit** and then click “[here](#)” to return
- select 
- Repeat the Port configuration for the other Port (PORT ID 2) – including g711ulaw, NT/clock master and last channel.

Table 1 can be used as a guide when setting up parameters for Vega 100 T1 ISDN installations.

Table 1. Network type, Line Encoding, and Topology

Product	Physical Connection	Network Topology	Network Type	DSLs	Framing	Line Encoding	Calls
Vega 100-PRI-T1	T1-1.544 Mbps	T1	AT&T 4ESS / 5ESS, NI 1 / NI 2, DMS-100	2	SF / ESF	B8ZS, AMI	23 / 46
Vega 100-PRI-T1	T1-1.544 Mbps	T1	QSIG	2	SF / ESF	B8ZS, AMI	23 / 46
Vega 100-T1-RBS_CAS	T1-1.544 Mbps	T1	RBS	2	SF / ESF	B8ZS, AMI	24 / 48

10. Configure pointer to CD ROM documentation

- On the left hand side menu select [LAN](#)
- Scroll to the bottom of the screen

The screenshot shows the 'Vega 100 T1E1 Online Configuration' interface. At the top, there's a navigation bar with File, Edit, View, Favorites, Tools, Help, Back, Forward, Home, Search, Favorites, Media, and Links. The address bar shows the URL: http://136.170.209.157/vsframe?sid=-1261603407&frame_id=1. The main content area has a 'VegaStream' logo on the left and a 'Vega 100 Configuration' title on the right. A sidebar on the left lists management options: Management, Logging, Maintenance, **LAN**, DSL, Dial Plan, DSP, Media, Tones, SIP, Users, QoS, and Advanced. The 'Advanced' option is currently selected. In the main pane, there's a 'Host Name' field set to 'Vega100T1E1', an 'IP Address' field set to '136.170.209.157', and a 'User Name' field set to 'admin'. A warning message '⚠️ Unsaved & Unapplied Changes' is displayed. Below this, under 'Physical Layer Configuration', there are fields for 'FTP Server' (136.170.209.214), 'NTP Offset (hhmm)' (0000), 'NTP Poll Interval' (0), 'Full Duplex' (unchecked), 'Ethernet Type' (10baseT & 100baseTX), and 'QoS profile' (1). A 'Submit' button is present. A table titled 'Lan Hosts' shows one entry: ID 1, Name loopback, IP 127.0.0.1, and a 'Modify' link. Buttons for 'Delete' and 'Add' are also shown. At the bottom of the page, a sidebar lists several configuration sections: **Advanced LAN Configuration** (with 'Advanced LAN' highlighted by a green oval), **Private Subnets Configuration** (with 'Private Subnets' highlighted), **NAT Configuration** (with 'NAT' highlighted), and **LAN Ports Configuration** (with 'LAN Ports' highlighted). Navigation buttons on the left include Save, Log off, Help, Reboot System, and Apply Changes.

- Select [Advanced LAN](#)
- Scroll to the bottom of the screen

Note
The default server is TFTP server. e.g.
Help\voIP\usrguide\framedefn.htm
or tftp://Help\voIP\usrguide\framedefn.htm
To specify a web server for help files, please use a full URL, e.g.
http://1.2.3.4/Help\voIP\usrguide\framedefn.htm

Save Log off Help Reboot System Apply Changes Submit Done Internet

To configure for operation using the CD in the local PC CD-ROM drive,

- Set Path or URL = D:/Content/help/v100t1s_R6.htm
- ... N.B. use forward slashes "/" not back slashes "\".

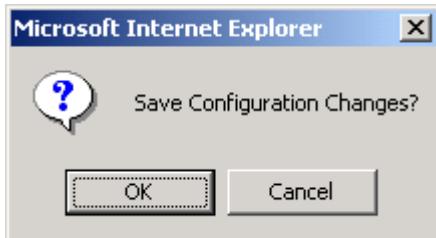

(Substitute the appropriate drive letter if D: is not the CD-ROM)

- select **Submit** and then click "[here](#)" to return

11. Save Changes

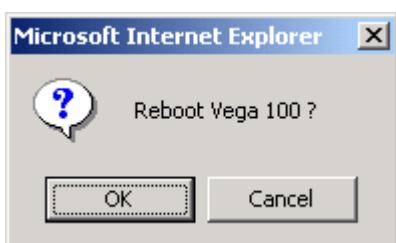

The changes to the configuration must be saved and activated. This is carried out as follows:

- On the left hand side menu select [Save](#)

- Select [OK](#) and after the configuration has been saved click "[here](#)" to return

- On the left hand side menu select [Reboot System](#)

- Select [OK](#)

The Vega will reboot and once back on-line, it will be ready to take its first call.

12. Archive Vega Configuration

Once configured it is recommended that the configuration is archived to an external server.

To do this check that the tftp address is configured to point to a tftp server (in the [LAN](#) page), then on the left hand side menu select [Advanced](#), and scroll to the CLI Command section:

CLI Command

- in the text entry box type “PUT tftp:initial_cfg.txt”. Select

This will send all the configuration parameters to the tftp server and save them as the file “initial_cfg.txt”. (Note: you may want to choose a unique name rather than “initial_cfg.txt”, especially if you are configuring more than 1 unit).

The Vega configuration can be archived to an ftp server instead of a tftp server by configuring the ftp server address in the [LAN](#) page and then typing the CLI command “PUT FTP:initial_cfg.txt”. (Again a unique name can be used in place of “initial_cfg.txt”)

If the ftp server requires a login username and password configure the following:

- set _advanced.lan.ftp.anonymous_login=0
- set _advanced.lan.ftp.username=<ftp username>
- set _advanced.lan.ftp._password-<ftp password>

13. Technical Support

Support information can be found on the VegaStream Support web site www.VegaAssist.com

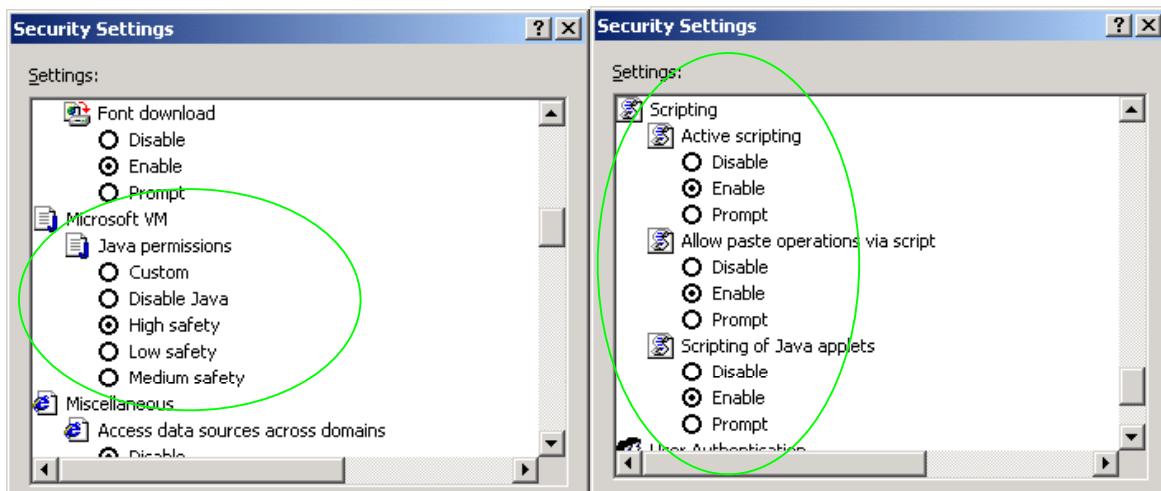

If you require help from VegaStream support personnel, please use the serial interface or telnet into the unit, log in and then type:

- show support
- sip monitor on
- log display on

Carry out the interaction you want explained, then copy the information provided by the Vega and e-mail it to support@VegaStream.com together with your question.

Notes:

1. If the screens do not appear as indicated, check that Java is enabled on your web browser (Tools>internet options>Security, select internet and custom level and configure Microsoft VM Java permissions and Scripting parameters as indicated below).

2. Where there are multiple sections – each with a **Submit** button – entries must be made to one section at a time, and those entries confirmed by the **Submit** button before the next section is altered. Each **Submit** button only confirms entries for its own section. Any changes in other sections will be discarded when the **Submit** is pressed.
3. Loss of audio mid call – consider reducing the selection of available codecs (see section 6). Some equipment, when presented with multiple codecs, may try and switch codec mid-call. Vegas do not support changing codec type mid-call.
4. Mismatched audio codecs. Use SIP monitor on to identify this. If the codecs of the endpoints are mismatched this will be reported as error 606 “No matching media”. To rectify, enable the appropriate audio codec (see section 6).
5. Outbound calls from the Vega send the INVITE to “Default Proxy Host Name/IP” with the request line: “INVITE sip: <dest TEL:>@Default Proxy Host Name/IP”.

14. Advanced configuration

T1 units have further configurable parameters which may be desirable to configure in order to fully integrate into the attached ISDN infrastructure.

14.1 Configure Vega 100 registration

For trunking gateways, registration is typically used to tell the Proxy that the Vega exists and is available to take calls. The number of users that need to be registered by the gateway on the SIP Proxy will depend on the Proxy's requirements, typically however, only a single registration is required.

For example, to register with a username "Vega100Gateway123"

- On the left hand side menu select [SIP](#)
- Scroll down to the **Registration** section

The screenshot shows the Vega 100 T1E1 Online Configuration interface in Microsoft Internet Explorer. The main title bar reads "Vega 100 T1E1 Online Configuration - Microsoft Internet Explorer". The left sidebar contains navigation links: Management, Logging, Maintenance, LAN, DSL, Dial Plan, DSP, Media, Tones, SIP (which is selected), Users, QoS, and Advanced. The main content area has a header "SIP > Registration > User". Below it are two tables: "SIP Tokens" and "SIP Authentication Users". The "SIP Tokens" table has two entries: Token 1 with Value vega1 and Token 2 with Value 01. The "SIP Authentication Users" table has one entry: User 1 with Enable 0, Username Prefix no prefix, Username Suffix no suffix, Username VegaGateway123, Built Username VegaGateway123, Password LetMeIn, and Source IF:.*. The right side of the interface features a large "Vega 100 Configuration" logo. At the bottom left is a "Modify SIP Registration User" form titled "SIP Registration User 1". It includes fields for Enable (unchecked), Dn (100), Username Prefix (none), Username Suffix (vega1), Username (reguser1), and Authentication User Index (1 - VegaGateway123). A green circle highlights the "Enable" checkbox, and another green circle highlights the "Username Suffix" dropdown set to "vega1". The "Authentication User Index" dropdown is also highlighted with a green circle. On the far left of the "Modify" form is a vertical stack of buttons: Save, Log off, Help, Reboot System, and Apply Changes.

In Modify SIP Registration User, SIP Registration User 1

- Tick Enable
- Set Username Suffix = none
- Set Username = Vega100Gateway123

- If Authentication will be needed for REGISTRATION
 ➤ Set Authentication User Index = Required Authentication User

Modify SIP Registration User

SIP Registration User 1	
Enable	<input checked="" type="checkbox"/>
Dn	100
Username Prefix	none
Username Suffix	none
Username	Vega100Gateway123
Authentication User Index	1 - VegaGateway123
<input type="button" value="Submit"/>	

➤ Select and then click “[here](#)” to return

➤ Save and reboot to activate

14.2 Configuring RBS CAS

➤ On the left hand side menu select [DSL](#)

In the **Port Configuration** section:

PORT Configuration

PORT ID	Enabled	NT	Clock Master	Layer 1	E1 rx Short Haul	T1 tx equalization	ISDN	CAS	Groups	Chg?
1	1	0	0	g711Ulaw64k	1	sh220_330	====>	====>	====>	Modify
2	1	1	1	g711Alaw64k	1	sh220_330	====>	====>	====>	Modify

➤ Select Modify
 ➤ Scroll down to the **CAS Configuration** section

CAS Configuration

Dial Format String	.
Digit Dial Timeout	6
Info	dtmf
Signal	em_wink
Tone Delay	
<input type="button" value="Submit"/>	

➤ Select the type of RBS CAS signalling

- em_wink = E & M wink start signalling
- loopstart = loop start signaling
- gndstart = ground start signaling
- fgd = E & M wink start signaling supporting feature group D (for caller ID)

CAS Configuration	
Dial Format String	<input type="text" value="."/>
Digit Dial Timeout	<input type="text" value="6"/>
Info	<input type="button" value="dtmf"/>
Signal	<input type="button" value="em_wink"/>
Tone Delay	<input type="text" value="50"/>
<input type="button" value="Submit"/>	

Dial Format String – this chooses the format of the dialled number DNIS and calling party number ANI. See the Vega Primer for more details.

Info – this selects whether the tones used to communicate on the CAS link are MF tones or DTMF tones.

Select Signal, Dial Format String and Info to match the device to which the Vega is going to be connected.

➤ select and then click “[here](#)” to return

14.3 Line impedance matching

In order to match the signal shapes produced by the Vega to the T1 line it is working with there is a parameter tx_equalisation that can be configured:

➤ set _advanced.isdn.tx_equalization=<tx_eq>

or on the web browser interface, in the **Port Configuration** section off the DSL page:

Port Configuration	
Port ID	<input type="text" value="1"/>
Enabled	<input checked="" type="checkbox"/>
Network Terminator	<input type="checkbox"/>
Clock Master	<input type="checkbox"/>
Layer 1	<input type="button" value="g711Alaw64k"/>
Set E1 RX short haul	<input checked="" type="checkbox"/>
T1 TX equalization	<input type="button" value="sh220_330"/>
<input type="button" value="Submit"/>	

<tx_equ> can take the following values:

lhlbo0	(long haul line break out 0 dB)
lhlbo7_5	(long haul line break out -7.5 dB)
lhlbo15	(long haul line break out -15 dB)
lhlbo22_5	(long haul line break out -22.5 dB)
sh0_110	(short haul 0-110 ft.)
sh110_220	(short haul 110-220 ft.)
sh220_330	(short haul 220-330 ft.) - default setting
sh330_440	(short haul 330-440 ft.)
sh440_550	(short haul 440-550 ft.)
sh550_660	(short haul 550-660 ft.)

Long haul values are used where the distance between the Vega and the closest repeater or other ISDN endpoint is greater than 660 feet. Short haul value lengths are the distance between the Vega and the closest repeater or other ISDN endpoint.

If the appropriate test and measurement equipment is not available to check the required setting, for long haul try **lhlbo0** and for short haul try **sh220_330**.

14.4 Channel Allocation Strategies

The Vega allows configuration of the channel allocation strategy to be used for each DSL on outgoing calls. Four options are available,

- i) *Linear_down* – where the Vega will use the highest available free channel to make the outbound call ... use this mode when the attached device is configured to make outbound calls using *Linear up*.
- ii) *Linear_up* – where the Vega will use the lowest available free channel to make the outbound call ... use this mode when the attached device is configured to make outbound calls using *Linear down*.
- iii) *Round_robin* – in this mode the Vega remembers the last allocated channel and then tries to use the next channel up from this for the next outbound call. (After reaching the highest channel ID it restarts at the lowest channel again.) ... use this mode when the attached device is configured to make outbound calls using *Round_robin* mode.
- iv) *Default* – if the DSL is configured as NT then the Vega will use the *Linear_up* scheme, and if the DSL is configured as TE then the Vega will use *Linear_down*.

By default the Vega has chan_alloc set=*Default*

Using the web browser interface:

- On the left hand side menu select [DSL](#)
- Then select the PORT ID to alter, select [Modify](#)
- Scroll to the bottom of the page

Vega 100 T1E1 Online Configuration - Microsoft Internet Explorer

Modify Port Group

Group ID	1
Port ID	1
Interface ID	01
Cost Index	1
DN	*
First Channel	1
Last Channel	auto
Alloc Channel	Default
Tunnel Mode	Default
<input type="button" value="Submit"/>	<input type="button" value="Submit"/>

A dropdown menu is displayed over the 'Alloc Channel' field, showing four options: Default, Linear Up, Linear Down, and Round Robin. The 'Default' option is selected. A green circle highlights this dropdown menu.

- Select the desired channel allocation strategy from the Alloc Channel pull down.
- select and then click "[here](#)" to return

- Save and reboot system to activate the change

14.5 User progress tones on TE interface

For ISDN to SIP calls, by default if the Vega DSL is configured as TE it will connect media through before or at alerting so that progress tones are passed through from end to end (i.e. for the ISDN caller to hear ringback and other progress tones the audio must be received over the SIP interface).

If it is required that the Vega generates these progress tones on the TE ISDN interface, then at the CLI prompt type:

- Set `_advanced.isdn.user_progress=1`
- Save and reboot system to activate the change

Notes:

1. If the Vega DSL is configured as NT it will always generate the call progress tones.
E.g. ringback and disconnect tones.
2. Typically `wait_for_connect` and `user_progress` configuration parameters should either both set to 1 or both set to 0.

14.6 In-band audio indication for alerting

For SIP to ISDN calls, by default the Vega will act upon the in-band audio indicator in the alerting message and if present will connect the media path.

If it is required that the Vega should ignore the in-band audio indicator, and so not pass on the in-band tone, then at the CLI prompt type:

- Set `_advanced.isdn.alert_with_progress=0`
- Save and reboot system to activate the change

If it is required that the Vega should always cut through the audio whatever the value of the in-band audio indicator, then at the CLI prompt type:

- Set `_advanced.isdn.alert_with_progress=2`
- Save and reboot system to activate the change

Further details on this and other parameters may be found in the Vega Primer.
